Reasonable Patent Exhaustion

I. Introduction: Patents and Patented Things

A lengthy tug of war between the Supreme Court and the Federal Circuit Court of Appeals very likely ended when the Supreme Court held that the sale of a patented article exhausts the patentee seller’s right to enforce restrictions on that article through patent infringement suits.¹ Further, reversing the Federal Circuit, the parties cannot bargain around this rule through the seller’s specification of conditions stated at the time of sale, no matter how clear. That is, the rule is not merely presumptive, but absolute once a sale of the patented article has occurred.

The patent first sale, or “exhaustion,” rule applies not to patents themselves but rather to the sale of patented “things.” To illustrate, if the patentee grants a production license to an office stapler manufacturer, authorizing it to employ its patented technology in its stapler, no thing is being sold. As a result, a limitation on where the patented stapler can be manufactured, in what amount, what the resale price will be,² or whether the manufacturer must bundle it prior to sale with the patentee’s staples is ordinarily enforceable insofar as patent law is concerned. If the patentee or licensee produces a stapler embodying the patented technology and then sells it, however, exhaustion becomes relevant for any restriction to be enforced on that particular stapler subsequent to the sale. The distinction is not between the presence or absence of a license. The purchaser of a patented office stapler automatically receives an implied license to practice that patent to the extent of using the stapler.³ That implied license does not give the purchaser a right to make more copies of the stapler. With respect to the stapler that the buyer actually purchases, however, the exhaustion rule says that the patentee may not by patent license impose conditions on the stapler’s subsequent use or sale and enforce these conditions through a patent infringement suit.

For example, suppose the patentee sells a stapler at wholesale to

²For example, under the “GE” rule a patentee can license a competing firm to manufacture the patented article and specify the price at which it is to be sold. United States v. General Electric Co., 272 U.S. 476 (1926).
Office Depot, and requires Office Depot to charge at least $15.00 to customers. That condition cannot be enforced by a patent infringement lawsuit, although it probably could be enforced by a breach of contract action. The contract lawsuit can ordinarily be brought only against those in privity of contract with the patentee, however. By contrast, if an infringement action were permitted, it could be brought against everyone who violates the condition, whether or not they are in privity or have ever agreed to be bound by the contract’s terms. Other differences could be important as well. For example, the patent infringement action can be maintained only in federal court under federal law, while the breach of contract action would ordinarily go to state court.

Further, because the question of patent infringement is federal it would override conflicting state policies. For example, suppose that resale price maintenance (RPM) were unlawful under state antitrust law, but that patent law permitted a post-sale infringement action against someone who violated an RPM condition. In that case the RPM condition would be enforceable as a matter of federal patent law, thus preempting the state prohibition. Since virtually anything that can be expressed in a contract can also be expressed as a condition on a sale, abolition of the first sale doctrine could effectively federalize the law of use restrictions on patented things. Of course, the federal antitrust laws would still operate. For example, Section 3 of the Clayton Act prohibits anticompetitive exclusive dealing or tying of goods “whether patented or unpatented.”

None of this will happen under the Supreme Court’s Impression Products decision, however. The Court stated what amounts to a per se rule that once a patented thing is sold, conditions imposed on that particular thing cannot be enforced via patent infringement suits. No further inquiry is made

---

4 Since 2007 resale price maintenance in the United States has been governed by a rule of reason. See Leegin Creative Leather Prods., Inc. v. PSKS, Inc., 551 U.S. 877 (2007). As a result, most instances of it are very likely lawful. ¶1620 (4th ed. 2017).

6 States may have their own antitrust laws which are at variance from federal law. See, e.g., O’Brien v. Leegin Creative Leather Products, Inc., 277 P.3d 1062, 1079 (Kan. 2012) (under Kansas antitrust law RPM remains unlawful per se: “federal precedents interpreting, construing, and applying federal statutes have little or no precedential weight when the task is interpretation and application of a clear and dissimilar Kansas statute”), rev’d on other grounds, 321 P.3d 799 (Kan. Ct. App. 2014).

into the patentee’s market power, anticompetitive effects, or other types of harms, whether enforcement of the condition is socially costly or valuable, or has a positive or negative impact on innovation. None of this is relevant.

II. Policy Concerns and Justifications

The *Impression Products* case reveals an economic deficiency that manifests all too frequently when patent law is brought to bear on market practices. Patent law has never developed tools for evaluating such practices. Economic concepts such as market power, output effects or effects on innovation, which are commonly used in economics and antitrust law, are virtually unknown in patent law. This fact has inclined the courts to go to wild extremes – such as equating every patent with monopoly, as it has often done,9 or concluding that a patent is a mere property right and that anything done within the scope of the patent should therefore be permissible.10 Too often the result is extreme rules that are indifferent to effects on innovation, competition, economic efficiency, or any other measure that seems relevant to innovation policy.

The patent exhaustion rule cannot be found in the Patent Act or any other federal statute. It is entirely judge made. It is particularly important that judge made deviations from a statute have an articulated policy. Statutes can be the consequence of politics or capture, or perhaps badly drafted. An important rationale for judge made deviations from a statute is to set things right or else fill statutory gaps. In this case the IP Clause of the Constitution authorizes Congress to create a patent act in order to promote innovation.11 This paper therefore assumes that an appropriate use of a judge made exhaustion rule must reflect concerns for promotion of innovation, or perhaps efficient distribution or production, or some other economic concern that is important to policy making in this area. An innovation-promoting rationale for the per se patent exhaustion rule is hard to find, however. To be sure, some post-sale restraints can be anticompetitive, and practices that restrain

---

trade can also restrain innovation. Post-sale restraints are generally “vertical.” They operate as between a seller and a buyer, and typically not between competing sellers or competing buyers. Decades of litigation under the antitrust laws has concluded that vertical restrictions should be treated more benignly than horizontal agreements involving competitors. Restrictions of the kind subject to patent exhaustion can be both socially harmful and socially beneficial. Establishing which of these is true ordinarily requires a detailed inquiry into market power and effects that antitrust law designates “the rule of reason.” Indeed, the overwhelming trend in antitrust jurisprudence over the last forty years has been to move away from per se rules for vertical restraints and toward a rule of reason. So why should the patent exhaustion rule be so draconian? One commonly given explanation is that most antitrust cases involving vertical restraints are limitations on breach of contract suits, not on patent infringement actions. That is certainly a factual distinction, but is it one that bears the weight now given to it? Permitting some enforcement actions via infringement suits can be socially valuable when (1) the restriction at issue is economically beneficial; but (2) breach of contract actions are not an adequate enforcement device.

Consider Impression Products itself. Printer manufacturer Lexmark sold its Lexmark-specific ink (toner) cartridges at a discount, provided the buyer agreed in advance to use the cartridge only once and then return the empty cartridge to Lexmark. Lexmark’s intent was not in controversy: it wished to dry up a secondary market for spent cartridges that firms such as Impression Products could then refill and sell, often at prices that were a small fraction of the amount that Lexmark charged for a new cartridge.

In antitrust terms, the practice that Lexmark was attempting to enforce was a variable proportion tying arrangement. In such a tie the buyer purchases one copy of a “tying” product, such as a printer, but then uses varying amounts of some secondary “tied,” product, such as toner cartridges.

---

14 E.g., Leegin Creative Leather Prods., Inc. v. PSKS, Inc., 551 U.S. 877 (2007) (resale price-maintenance, sometimes known as vertical price fixing, to be governed by rule of reason); NYNEX Corp. v. Discon, Inc., 525 U.S. 128 (1998) (purely vertical concerted refusal to deal, as opposed to horizontal refusal, to be governed by rule of reason).
15 Impression Products, 137 S. Ct. at 1525-1526.
Under a tie, printer purchasers would be required to purchase cartridges from Lexmark rather than from independent firms who refurbish used cartridges. Today the general although not unanimous consensus among antitrust economists is that variable proportion tying agreements are devices for facilitating second degree price discrimination, that they typically result in increased output, and that the welfare gains that they produce exceed losses, perhaps by a wide margin. In any event, the practice can be imposed anticompetitively only if the seller has a significant market position. As a result, even those who are more skeptical would generally require that the firm imposing the tie be a monopolist or dominant firm. In this case Lexmark clearly was not. Its share of the highly competitive consumer laser printer market is less than 5%, making it significantly smaller than rivals Hewlett-Packard, Epson, Canon, and Brother.

So Lexmark’s printer-cartridge tie was very likely welfare increasing. At the very least, it was sufficiently ambiguous that further inquiry into market power and competitive effects would be essential to answering the welfare question. It would be difficult to impossible for Lexmark to enforce a tying condition imposed directly on consumers via breach of contract suits, however, as the Supreme Court elaborated. Lexmark had even attempted to use a microchip pairing of printer and cartridge in order to prevent use of competitors’ cartridges, but the Sixth Circuit had refused to find copyright violations by rivals who duplicated or invented around the chips. The license condition against reuse was imposed on end users, for only they use up the cartridges. While one might get purchasers of printers to agree not to use anything but Lexmark’s own cartridges, there is no effective means for

---

16 See Erik N. Hovenkamp & Herbert Hovenkamp, Tying Arrangements and Antitrust Harm, 52 Ariz. L. Rev. 925 (2010). Under variable proportion tying a dominant firm drops the price of the tying product, sometimes to zero, but raises the price of the tied product. The practice produces economic gains to low intensity uses, bringing many new ones into the market, but can harm some higher intensity users. How harms and benefits net out is an empirical question. See id. at 937-940. Contrast Einer Elhauge & Barry Nalebuff, The Welfare Effects of Metering Ties, J. L., Econ., & Org. (forthcoming 2017) (arguing that variable proportion ties can reduce welfare when the seller is a monopolist).

17 E.g., id. (speaking repeatedly of defendant as “price-discriminating monopolist”).

19 See Impression Products, 137 S.Ct. at 1528-1530 (detailing history of Lexmark’s attempts to enforce the tie).

Lexmark to discover violations and enforce such a contract. By contrast, the refilling companies, such as infringement defendant Impression Products, are fewer and must sell in publicly accessible places such as Amazon.com. They could therefore be identified. They are not in privity of contract with Lexmark, however. As a result, the ability to turn a violation of the tying clause into a patent infringement suit was very likely the only effective mechanism Lexmark had for enforcing its tie. With a properly posted notice, Lexmark could warn Impression Products and other refillers that their activity constituted patent infringement.

Thus the Supreme Court’s decision very likely prevented Lexmark from using a socially valuable device that could be expected to lower the cost of owning and operating computer printers. In the Kirtsaeng case, which involved copyright law’s statutory first sale doctrine, Justice Breyer advocated that competition policy be brought to bear. He noted Lord Coke’s seventeenth century statement that post-sale restraints are “against Trade and Traffique, and bargaining and contract,” and located these concerns within competition law. Justice Breyer’s rationale for the first sale doctrine emphasized “the importance of leaving buyers of goods free to compete with each other when reselling or otherwise disposing of those goods.” For that proposition he cited an antitrust case and an antitrust treatise. By contrast, in Impression Products Chief Justice Roberts quoted the same passage from Lord Coke, but emphasized its relationship to the common law’s hostility toward restraints on the alienation of chattels, citing both Coke’s Institutes and John Chipman Gray’s treatise on that subject.

Seventy years after the Supreme Court applied the first sale doctrine to copyright, Congress codified the doctrine in a revised Copyright Act. Although the patent first sale doctrine is much older, Congress has never

---

21 Because customers want printing services the proper cost is the one of the combination of printer and cartridges that the customer uses, not of printers alone or cartridges alone. That is, the two are strong complements.

24 Impression Products, 137 S.Ct. at 1526.

28 Dating to Bloomer v. Mcquewan, 55 U.S. 539 (1852).
done the same thing in the Patent Act. Two statutes have spoken to the issue of patent exhaustion, and then only indirectly. One is §3 of the Clayton Act, an antitrust provision passed in response to the Supreme Court’s 1912 *Henry* decision. The other, of which more later, is the Patent Misuse Reform Act.29

In *Henry* the Supreme Court recognized an exception to the first sale doctrine for “conditional” sales, just as the Federal Circuit had been doing prior to *Impression Products*.30 Writing for the Court, Justice Lurton explained that the sale of a patented thing could be either unconditional or conditional. If it was unconditional, then the exhaustion rule applied. By means of a conditional sale, however, the patentee could “sever” any indicia of ownership that it wished, for severability was inherent in the nature of a property right.31

The *Henry* Court then went on to approve enforcement of a variable proportion tying arrangement via a patent infringement action, on facts quite similar to those in *Impression Products*. Patentee A.B. Dick, a large manufacturer of office equipment, sold its patented mimeograph copy machine subject to a clearly printed license restriction attached to each copy of the machine. The restriction stated that the machine could be used only with paper, ink, and stencils supplied by A.B. Dick itself.32 Because the notice was prominently attached to each machine, one could reasonably expect it would be communicated to subsequent users, whether or not they were in privity of contract with the patentee. Henry was the operator of an

---

29 See discussion infra, text at notes ___

31 See *Henry v. A.B. Dick Co.*, 224 U.S. 1, 24-25 (1912):

`The property right to a patented machine may pass to a purchaser with no right of use, or with only the right to use in a specified way, or at a specified place, or for a specified purpose. The unlimited right of exclusive use which is possessed by and guaranteed to the patentee will be granted if the sale be unconditional. But if the right of use be confined by specific restriction, the use not permitted is necessarily reserved to the patentee. If that reserved control of use of the machine be violated, the patent is thereby invaded. This right to sever ownership and use is deducible from the nature of a patent monopoly and is recognized in the cases.`

32 See id. at 11:

`License Restriction.`

`This machine is sold by the A. B. Dick Company with the license restriction that it may be used only with the stencil paper, ink, and other supplies made by A. B. Dick Company, Chicago, U. S. A.`
office supply store who sold a can of ink to a purchaser of the machine, knowing that the purchaser intended to use it in violation of A.B. Dick’s condition.33

The Supreme Court concluded that exhaustion did not apply to clearly conditional sales. Neither could it find anything in the Sherman Act, which had been passed twenty-two years earlier, that spoke to the patent licensing practice at issue.34 As a result neither patent law nor antitrust law prevented enforcement of the tie. *Henry* was only one of many decisions that applied patent exhaustion selectively, depending on whether the sale of the patented good was conditional or unconditional,35 but often paying little attention to the nature of the restriction that the condition imposed. For its part, the Federal Circuit adhered to the conditional use distinction, even after the Supreme Court appeared to overrule it in its *Quanta Products* clearly has brought that to an end.

Whether the drafters of the Sherman Act had intended for the statute to apply to patent ties is doubtful. The statute never mentions patents. Nevertheless, Congress was clearly unhappy with the *Henry* decision. It

33*Henry’s* act was one of “contributory” infringement. Liability for contributory infringement was subsequently (1952) narrowed to cover only the sale of things not capable of substantial noninfringing uses. 35 U.S.C. §271 (c) (2012). The ink in the *Henry* case almost certainly had substantial noninfringing uses.

34*Henry*, 224 U.S. at 30. The Court quoted with approval Justice Peckham’s opinion ten years earlier in E. Bement & Son, Inc. v. National Harrow, Inc., 186 U.S. 70, 92 (1902), that the Sherman Act

clearly does not refer to that kind of a restraint of interstate commerce which may arise from reasonable and legal conditions imposed upon the assignee or licensee of a patent by the owner thereof, restricting the terms upon which the article may be used and the price to be demanded therefor. Such a construction of the act, we have no doubt, was never contemplated by its framers.

The *Bement* decision went on to uphold a price fixing provision contained in a patent cross-license.

35 E.g., *Keeler v. Standard Folding Bed Co.*, 157 U.S. 659, 663 (1895) (applying exhaustion when the patentee “has himself constructed a machine and sold it without any conditions…”); *Mitchell v Hawley*, 83 U.S. 544, 547 (1872) (“without any conditions”); *Providence Rubber Co. v. Goodyear*, 76 U.S. (9 Wall.) 788, 799 (1870) (refusing to apply exhaustion when the licensee expressly restricted licensee to produce one type of article but licensee produced a different one); *American Cotton-Tie Co. v. Simmons*, 106 U.S. 89 (1882) (enforcing restriction explicitly made at time of sale that metal tie sold for baling cotton could be used only once); *Aro Mfg. Co. v. Convertible Top Replacement Co.*, 365 U.S. 336, 356 (1961) (dicta approving *American Cotton-Tie*).

responded, however, by amending the antitrust laws rather than the Patent Act. Section 3 of the Clayton Act, which was enacted two years after Henry, made it unlawful to sell a product, “whether patented or unpatented,” on the condition that the purchaser not deal in a competitor’s goods. Further, it added the language “where the effect may be substantially to lessen competition or tend to create a monopoly” – a clear sign that it did not intend to condemn all such tying conditions categorically, but only under a rule of reason that distinguished competitively harmful practices.

The one thing that Congress did not do in response to A.B. Dick was amend patent law so as to eliminate patent exhaustion doctrine’s distinction between conditional and unconditional sales. Rather, in the eyes of Congress in 1914, addressing the problem of A.B. Dick’s tying arrangement was more a question of antitrust policy than patent policy. Further, as an antitrust question it required an analysis of competitive effects and not a categorical

---

It shall be unlawful for any person … to lease or make a sale or contract for sale of goods, wares, merchandise, machinery, supplies, or other commodities, whether patented or unpatented, .. on the condition, agreement, or understanding that the lessee or purchaser thereof shall not use or deal in the goods, wares, merchandise, machinery, supplies, or other commodities of a competitor or competitors of the lessor or seller, where the effect of such lease, sale, or contract for sale or such condition, agreement, or understanding may be to substantially lessen competition or tend to create a monopoly in any line of commerce.

In addition to §3 of the Clayton Act, one other statutory provision may be at least remotely relevant to exhaustion, although that it hardly clear. See 35 U.S.C. §271(c) (2012):

(e) Whoever offers to sell or sells within the United States or imports into the United States a component of a patented machine, manufacture, combination or composition, or a material or apparatus for use in practicing a patented process, constituting a material part of the invention, knowing the same to be especially made or especially adapted for use in an infringement of such patent, and not a staple article or commodity of commerce suitable for substantial noninfringing use, shall be liable as a contributory infringer.

Under this provision, someone who sold ink for use in an A.B. Dick machine could not be guilty of contributory infringement because the ink is capable of many noninfringing uses. That does not necessarily means, however, that such a seller could evade the posted license restriction at issue in that case. In any event, the provision was enacted in 1952, forty years subsequent to Henry.
rule that simply condemned every such arrangement automatically. Thus the most sensible reading of the Congressional response to *Dick* was that it had no wish to jettison the “condition” distinction for patent exhaustion, but it did want antitrust law to determine which conditions could be enforced and which could not be.38

III. Rationales

While competition policy may or may not provide the proper rationale for the first sale doctrine, *some* policy justifying a purely judicial deviation from an elaborate statute such as the Patent Act seems to be in order. An argument from Congressional intent seems very weak. In his opinion for the Court in *Impression Products*, Justice Roberts made something of the fact that Congress has had numerous opportunities to amend the Patent Act so as to eliminate judge made exhaustion, but had never done so. Factually that is true, but it might lead to just the opposite conclusion than the Chief Justice drew. For example, the Supreme Court created a judge made exhaustion rule for copyright in 1908 in the *Bobbs-Merrill* case. Congress validated that decision nearly 70 years later by making the doctrine statutory.39 In the case of the Patent Act, however, Congress has neither statutorily recognized the doctrine nor statutorily rejected it. So one could as easily conclude that it was indifferent. It is also clear that Congress has never responded to the “conditional” sales distinction that has appeared repeatedly in the cases. In fact, for tying cases it expressly embraced it.40 In sum, one cannot conclude from Congressional behavior that Congress wanted the particular exhaustion rule that *Impression Products* developed.

Further, the one policy rationale on which the *Impression Products* Court rested – a policy against restraints on alienation – seems poorly suited to the situation, for reasons to be discussed later.41 Prior to that many of the Supreme Court’s first sale decisions stated a rationale, but these were often quite different from one another.

38 For example, by 1914 the Supreme Court had already applied antitrust’s per se rule to resale price maintenance, indicating that the Courts would not enforce a resale price maintenance clause contained in a patent license. *See* Dr. Miles Medical Co. v. John D. Park & Sons Co., 220 U.S. 373 (1911). Indeed, the Court had already done the same thing for copyright licenses. *Bobbs-Merrill Co. v. Straus*, 210 U.S. 339 (1908) (first sale doctrine precluded application of copyright license restriction setting resale price of book).

40 *See* discussion supra, text at notes __.

41 *See* discussion *infra*, text at notes ___
A. Retroactive Extensions of the Patent Term

The first decision to apply the patent exhaustion rule, Bloomer v. McQuewan, had a clear and principled rationale which was followed in one subsequent case and then abandoned because it was so specific to particular legislative facts. The patentee, William Woodworth, owned a very important patent on a wood planing machine. As the patent neared its expiration, Woodworth lobbied Congress and received a retroactive extension of the patent term in the 1836 Patent Act. Woodworth died soon after, but his son was able to obtain a second extension in an Act of Congress that applied only to his patent, mentioned by name. Bloomer was a manufacturing licensee under the patent, and McQuewan was a purchaser/user of at least one of the machines. The original patent term had expired during McQuewan’s ownership of the machine, and McQuewan had accordingly stopped paying royalties. When the patent was retroactively extended, however, Bloomer demanded that McQuewan pay royalties again for the remaining life of the revived patent. The question before the Supreme Court was whether extension of the patent term served to extend the royalty obligation retroactively to buyers who had purchased the patented product, agreeing to pay royalties for the life of the patent under the shorter term in effect at the time they made their purchase.

The case thus implicated concerns similar to those expressed by the Contract Clause of the Constitution – that is, of legislative rewriting of an executed contract so as to make its terms less favorable to one of the parties. The Contract Clause applies only to the states, however, and patent law is federal. Chief Justice Taney rather creatively attached Contract Clause concerns to the Fifth Amendment Due Process clause, creating what many people regard as the historical foundation for Substantive Due Process

42 Bloomer v. McQuewan, 55 U.S. (14 How.) 539 (1852).
47 U. S. Const. Art. I, §10, cl. 1 (“No State shall … pass any … Law impairing the Obligation of Contracts…”).
analysis, which developed in the state courts thirty years later:

The right to construct and use these planing machines, had been purchased and paid for without any limitation as to the time for which they were to be used. They were the property of the respondents [i.e., McQuewan, the purchaser of the machine]. Their only value consists in their use. And a special act of Congress, passed afterwards, depriving the appellees of the right to use them, certainly could not be regarded as due process of law.

Congress undoubtedly have power to promote the progress of science and useful arts, by securing for limited times, to authors and inventors, the exclusive right to their respective writings and discoveries. But it does not follow that Congress may, from time to time, as often as they think proper, authorize an inventor to recall rights which he had granted to others; or reinvest in him rights of property which he had before conveyed for a valuable and fair consideration.⁴⁸

The issue of a legislated patent term extension subsequent to the sale of a patented product makes Bloomer relatively unique among patent exhaustion cases. Mitchell v. Hawley,⁴⁹ decided twenty years later, also applied something akin to the first sale doctrine to hold that the retroactive term extension created in the 1836 Patent Act did not revive the right to an injunction against someone who purchased the patented good under the original term. No subsequent patent exhaustion case has implicated a retroactive term extension or Congressional modification of an existing license agreement.⁵⁰

The facts of Bloomer thus make it a one-off, forcing later decisions to look for different rationales. Justice Miller’s opinion in Adams v. Burke,⁵¹ the Supreme Court’s next major patent exhaustion decision, is notable for both its brevity and its formalism. Further, it is not clear that the decision implicated the first sale doctrine at all. The patentee had licensed various manufacturers to make its coffin lids in designated parts of the country. These licenses to manufacture did not implicate the first sale doctrine because

---

⁵⁰ Cf. Eldred v. Ashcroft, 537 U.S. 186 (2003), which upheld a statutory copyright term extension in an action brought by users of copyrighted works which had fallen into the public domain but were revived by the extension. However, it appears that no petitioner alleged that he or she had purchased a work under an ongoing royalty requirement which had lapsed but which the term extension had now revived.
nothing was being sold. Indeed, territorially restricted production licenses are expressly authorized by the Patent Act, at least when they are domestic. Adams was not a coffin manufacturer but an undertaker. He legally purchased a finished coffin containing the patented lid from a manufacturer who had a territorially restricted license. The lawsuit was apparently based on the premise that because the manufacturer was licensed to produce the coffin lids and sell them in a designated area, the purchaser/user implicitly operated under the same limitation. Nevertheless, the sale from the manufacturing licensee to Adams was “without condition or restriction.”

It is worth noting that the presumptive antitrust rule for territorial restrictions has always been that a restriction on an intermediary does not automatically extend to the end user. For example, an automobile dealer location clause restricts the area in which the dealer can make sales, but that itself does not serve to restrict the area in which the dealer’s customers can drive the car. A franchise contract such as one for McDonald’s almost certainly includes a location restriction imposed on the franchisee, but no court has ever held such a clause requires the customer to eat her hamburger inside the store. So one thing missing from Adams was an analysis of the likely intended effect of the territorial restriction — i.e., whether it applied only to the manufacturer or reached through to the subsequent user.

Nevertheless, the premise of Justice Bradley’s dissent was the ancient property law principle that one cannot convey a greater title than he owns:

“If it be contended that the right of vending the lids to others enables them to confer upon their vendees the right to use the lids thus sold outside of the limited district, the question at once arises, how can they confer upon their vendees a right which they cannot exercise themselves? The only consistent construction to be given to such an assignment is, to limit all the privileges conferred by it to the district marked out. It is an assignment of the manufacture and use of the patented article within that district, and within that district only. The plaintiff in Adams was a different licensee, whose manufacturing license covered the territory in which Adams buried the coffin in question.

---

52 See 35 U.S.C. § 261 (2012) (granting patentee the right to “grant and convey an exclusive right under his application for patent, or patents, to the whole or any specified part of the United States....”

53 See Adams, 84 U.S. at 454-455. The lower court contains somewhat more elaboration but describes the license and sale in the same way. Adams v. Burks, 1 Holmes 40, 1 F. Cas. 100 (1871).

54 E.g., White Motor Co. v. United States, 372 U.S. 253 (1963) (territorial restriction imposed on large truck distributor).

55 Adams, 84 U.S. at 458-459.

56 See Adams v. Burke, 1 Holmes 40, 1 F.Cas. 100, 100 (C.C.D.Mass, 1871).
The patentee had assigned exclusive territories to manufacturing licensees, but did so by conveying the entire interest in the patent to each licensee. Adams the undertaker apparently had a license only by virtue of the fact that the purchaser of a patented good always receives an implied license to practice the patent to the extent of using that good. The patent itself was minor, although perhaps not trivial. Coffins of the day bore a small metal plate on the lid stating the decedent’s name and other information. Because the plate was on the lid, however, it could be seen by mourners only when the lid was closed. The patentee placed a recess in the lid between the hinges that permitted the name plate to be viewed when the lid was either open or closed, thus making the plate viewable in open casket funerals.

B. Distinguishing Unconditional from Conditional Licenses

The Adams opinion also contained the language that the Federal Circuit came to rely on in its own exhaustion jurisprudence, but which the Supreme Court rejected in Impression Products. Adams held that “When a patented product passes lawfully into the hands of a purchaser without condition or restriction, it is no longer within the monopoly or under the protection of the patent act, but outside of it.” So when the Henry Court repeated that formulation forty years later it was merely following existing law.

After Adams, the courts justified patent exhaustion with several different, sometimes overlapping rationales. Commentators have also inferred rationales that were not often expressed in judicial decisions, although they may have been implied. One rationale was based on the distinction between conditional and unconditional sales that Adams, Henry and numerous other decisions stated. A second was a concern that the law of patented things (as opposed to the law of patents) needed to be reserved to the extent possible to other bodies of law, such as commercial law -- or more pointedly, to the states. A third rationale, articulated frequently after the Clayton Act was passed, was that the first sale doctrine served to limit anticompetitive vertical agreements, and thus pulled in tandem with both the

62 See discussion infra, text at notes __.
antitrust laws and the developing patent “misuse” doctrine.\textsuperscript{63} Finally, concerns about outlawing restraints on the alienation of chattels were acknowledged, but only infrequently. The concern with restraints on alienation was articulated more often in copyright law as well as the developing antitrust law of vertical restraints. In the latter it formed the rationale for the set of per se rules against vertical restrictions that the Supreme Court initially developed but later largely rejected.\textsuperscript{64}

Historically the most frequently stated rationale for the first sale doctrine was a version of the one that the Federal Circuit was following at the time of \textit{Impression Products}: it distinguished unconditional from conditional sales of patented things. Once a patentee had made an unconditioned sale of a patented thing, then any use restriction imposed on the purchaser was unenforceable. On the other hand, conditional sales should be enforced when the limiting condition was clear and simultaneous with (or announced prior to) the sale.

The common law had always recognized that property owners could transfer something less than their “entire” interest in property, and patents were no exception. Speaking for the Supreme Court, Justice Peckham observed this in the 1902 \textit{Bement Harrow} case, which upheld patent cross-licenses issued on the condition that the parties set a specific price for their patented harrows.\textsuperscript{65} The “general rule is absolute freedom in the use or sale of rights under the patent laws...” he wrote:

\begin{quote}
The very object of these laws is monopoly, and the rule is, with few exceptions, that any conditions which are not in their very nature illegal with regard to this kind of property, imposed by the patentee and agreed to by the licensee for the right to manufacture or use or sell the article, will be upheld by the courts. The fact that the conditions in the contracts keep up the monopoly or fix prices does not render them illegal.\textsuperscript{66}
\end{quote}

The distinction between conditional and unconditional sales effectively turns the patent exhaustion rule into a drafting problem, at least to the extent that the particular condition does not violate antitrust law or some other legal policy. As the Federal Circuit articulated it in its now overruled \textit{Mallinckrodt} decision, the “principle of exhaustion of the patent right did not turn a conditional sale into an unconditional one.”\textsuperscript{67} The court then noted numerous

\begin{footnotes}

\end{footnotes}
Supreme Court decisions that had rested exhaustion on the distinction between conditional and unconditional sales,\(^68\) concluding that:

Adams v. Burke and its kindred cases do not stand for the proposition that no restriction or condition may be placed upon the sale of a patented article…. Unless the condition violates some other law or policy (in the patent field, notably the misuse or antitrust law…), private parties retain the freedom to contract concerning conditions of sale.\(^69\)

As Mallinckrodt read the twentieth century case law, the decisions refusing to enforce a post-sale restriction even when a clear condition had been stated did not rest on the first sale doctrine at all, but rather on the conclusion that the particular condition being asserted amounted to misuse or an antitrust violation.\(^70\)

### C. Trading Off Duration and Enforcement Scope

When a practice such as tying, exclusive dealing, resale price maintenance or something else is found unlawful under the antitrust laws, it is typically condemned no matter whether it is enforceable by contract or infringement action. But does a class of restraints exist that, while enforceable by breach of contract action, should not be enforceable by infringement suit? On the one hand, the duration of a restraint enforced by contract is as long as the contract is enforceable, perhaps indefinitely. That includes trademarks and trade secrets, whose duration is indefinite. By contrast, a restraint enforceable by a patent infringement action can last no longer than the enforceable life of the patent. So if the duration of the restraint is an important factor the patent infringement suit has the advantage.\(^71\)

---

\(^68\) *Id.* at 706-707.

\(^69\) *Id.* at 708.

\(^70\) Patent “misuse” is another judge-made set of rules that refuse to enforce patents that have been “misused,” most typically by tying or some related practice. On patent misuse and its relation to antitrust, see 10 PHILLIP E. AREEDA & HERBERT HOVENKAMP, ANTITRUST LAW ¶1782 (4th ed. forthcoming 2018).

\(^71\) Then Sixth Circuit Judge Lurton made this point in his opinion in the *Dr. Miles* resale price maintenance case which the Supreme Court subsequently affirmed. RPM enforced through IP licensing, he observed, “has a limitation of a few years” and requires the inventor to put his invention on record. By contrast, speaking of a price restraint enforceable by a contract action:

Not so with the monopoly asked for by those who control the enormous proprietary trade of this country. Their monopoly will go on forever, and, if there be merit in their formula, they may not only preserve it through all time, but continue to restrain prices and prevent
On the other hand, because infringement actions do not require privity of contract, they can reach a broader set of potential defendants. That is not a bad thing, however, unless enforcement itself is socially harmful. As noted earlier, if the restraint at issue is welfare increasing, then enforcement via infringement actions is preferable to no enforcement at all. The current law of exhaustion does not make any of these distinctions. Once a qualifying sale occurs the post-sale restraint is unenforceable, no matter what its consequences for welfare, competition, or innovation.

D. Preserving Room for the Law Patented Things – Concerns for Federalism

Duffy and Hynes have argued that the central purpose of the exhaustion doctrine was to preserve space for other areas of law, such as commercial law.\footnote{John F. Duffy & Richard Hynes, Statutory Domain and the Commercial Law of Intellectual Property, 120 VA. L. REV. 1 (2016).} Under this rationale the Patent Act creates a regime for controlling patents, but other bodies of law control the use, sale, or deployment of patented things. For example, an insecticide might be patented, with composition and right to manufacture controlled by the Patent Act. Nevertheless, numerous other bodies of law govern the use, production, and sale of the insecticide itself – the enforceability of sales contracts and remedies for breach, the conditions under which it may be manufactured, whether and when it can be used or even whether it can be used at all,\footnote{See, e.g., Patterson v. Kentucky, 97 U.S. 501 (1878) (fact that a fuel oil was patented did not defend against state statute prohibiting its use as unsafe). See also Webber v. Virginia, 103 U.S. 344, 347 (1880) (“The patent for a dynamite powder does not prevent the State from prescribing the conditions of its manufacture, storage, and sale, so as to protect the community from the danger of explosion. A patent for the manufacture and sale of a deadly poison does not lessen the right of the State to control its handling and use.”).} how it is to be sold, anticompetitive restraints on its sale, or how it must be labeled.

This is an intuitively appealing rationale for Patent exhaustion. It is not a rationale that the courts have often articulated, however, at least not in the form that Duffy and Hynes describe it. Another problem is that it creates a kind of ratchet. Patent exhaustion makes room for alternative bodies of law when they are more restrictive. It does so less well when they are more permissive. For example, exhaustion accommodated the concerns of antitrust quite well when antitrust was on an expansion course, making per se competition in the sale of the product. It is said that the proprietor of such a secret remedy need never communicate his formula.

Dr. Miles Med. Co. v. John D. Park & Sons Co., 164 F. 803, 806 (6th Cir. 1908), aff’d, 220 U.S. 373 (1911).
unenforceable what antitrust was also making unlawful per se. The two most important categories were tying arrangements and resale price maintenance, which were two of the practices most frequently involved in first sale situations. Both were historically unlawful per se. However, when antitrust changed course and began to see these practices as more benign or even as economically efficient, the first sale doctrine went right on denying enforcement, as it did in the *Impression Products* case. As noted earlier, to the extent that the variable proportion print/cartridge tie at issue in *Impression Products* is socially efficient and cannot effectively be enforced by a breach of contract suit, the first sale doctrine serves to frustrate rather than support antitrust goals.

I have proposed a variation, which I believe is more faithful to the historical development of the patent exhaustion doctrine. Further, it was widely cited by the courts as the rationale. The purpose of the exhaustion doctrine was to preserve the boundary between the federal law of patents and the largely state law of patented things. During the nineteenth century patent law increasingly became federal, although the Supreme Court would not get around to preempting state issued patents until the 1960s. A frequently articulated rationale for patent exhaustion during that time was that the doctrine served to distinguish between the federal law of patents, as covered by the Patent Act and IP clause of the Constitution, from state law governing the sale and use of patented objects. The Tenth Amendment guarantees that powers not delegated to Congress under the IP Clause or potentially overlapping provisions such as the Commerce Clause should be reserved to the states.

Chief Justice White articulated this position very forcefully in his dissent from the Supreme Court’s *Henry* decision approving a variable proportion patent tie accomplished by a conditional sale. Speaking of the majority’s holding that the Patent Act entitled the patentee to enforce its tie via an infringement action, White complained that the effect was:

… to destroy, in a very large measure, the judicial authority of the states by unwarrantedly extending the Federal judicial power. ... [T]he gravity of the consequences which would ordinarily arise from such a result is greatly aggravated by the ruling now made, since that ruling not only vastly extends the Federal judicial power, as above stated,

---

but as to all the innumerable subjects to which the ruling may be made to apply, makes it the duty of the courts of the United States to test the rights and obligations of the parties, not by the general law of the land, in accord with the conformity act, but by the provisions of the patent law, even although the subjects considered may not be within the embrace of that law, thus disregarding the state law, overthrowing, it may be, the settled public policy of the State, and injuriously affecting a multitude of persons.\textsuperscript{77}

As the Chief Justice realized, because a condition in a patent license could be drafted to cover everything a contract could cover, the impact of not finding exhaustion would be to federalize state commercial law, state competition law, or any other body of state law having to do with the use or sale of patented things. \textit{As Henry} was being written in 1912 state antitrust laws were just starting to deal with practices such as resale price maintenance and tying.\textsuperscript{78} Federal law had already condemned resale price maintenance\textsuperscript{79} but there was as yet no federal antitrust law of tying. \textit{The Henry} ruling permitting A.B. Dick to enforce its tying restriction effectively preempted any state law attempt to condemn such ties. That is why Congress responded two years later by making anticompetitive ties subject to federal law.\textsuperscript{80} In sum, the logic of \textit{Henry} enabled federal infringement law to ride roughshod over state law.

Chief Justice White was hardly the first to see patent exhaustion in terms of federalism. In fact, his dissent reflected a view stated in several court opinions that stretched back to the mid-nineteenth century. That view, quite simply, was that when a device was sold it passed from the patent law written by Congress to the domain of state common and statutory law governing the sale and use of goods. This was an essential mechanism for identifying the boundary between the power granted by the IP clause of the Constitution to the federal government, and state power to control commerce in everything that federal law did not embrace.

In 1859 the Supreme Court defined patent exhaustion as stating that “[b]y a valid sale and purchase, the patented machine becomes the

\textsuperscript{77} \textit{Id.} at 49-50.

\textsuperscript{79} Dr. Miles Medical Co. v. John D. Park & Sons Co., 220 U.S. 373, 405 (1911).

private individual property of the purchaser, and is no longer protected by the laws of the United States, but by the laws of the State in which it is situated.”81

The Supreme Court and lower courts repeated that formulation many times in patent exhaustion cases during the latter half of the nineteenth century and first quarter of the twentieth century.82 It was used at least twice by the Supreme Court in variable proportion patent tying cases similar to Henry and Impression Products, and several additional times by lower federal courts.83 In all of these cases the court’s cited these concerns for federalism, virtually always quoting the language from Chaffee.

As in so many areas, these concerns for federalism disappeared during the Progressive Era and the New Deal84 as federal authority over patented things expanded, most notably under the antitrust laws, but also later under the expansion of federal Commerce Clause power recognized in Wickard v. Filburn.85 Beginning with the Motion Picture case in 1917, the Court increasingly saw the exhaustion doctrine as a complement, not so much to state commercial law, but rather to federal antitrust.86

E. Competition Concerns Rationalizing Exhaustion

In Henry the Court rejected the defendant’s argument that the Sherman Act had anything to say about the variable proportion patent tie at issue in that case. Congress passed the Clayton Act two years later, however, mentioning patents for the first time in an antitrust law. In its first subsequent exhaustion case, Motion Picture Patents, the Supreme Court found linkage and rejected the “condition” distinction.87 The Clayton Act served to “confirm” the Court’s view that the patent tie requiring users of the patentee’s

83 Morgan Envelope Co. v. Albany Perforated Wrapping Paper Co., 152 U.S. 425 (1894) (exhaustion applied to tie of patented toilet paper dispenser to toilet paper); Wilson v. Simpson, 50 U.S. 109 (1850) (purchaser of Woodworth planning machine had right to replace worn out blades with those of his own making); Wagner Typewriter Co. v. F.S. Webster Co., 144 F. 405 (C.C.S.D.N.Y. 1906) (same; tie of typewriter to typewriter ribbons); Aiken v. Manchester Print Works, 1 F. Cas. 245, 246-247 (C.C.d.N.H. 1865) (same; tie of patented knitting machine to disposable knitting needles);
85 317 U.S. 111 (1942).
87 Id. at 514. As in Henry, the condition was clearly stated in a notice affixed to each projector sold.
projector to show only its films was both unenforceable under the exhaustion rule and an antitrust violation. Justice Holmes dissented, making clear that he would have preserved the distinction between conditional and unconditional sales.

For some time thereafter antitrust policy and the first sale doctrine pulled in tandem, culminating in the *Univis Lens* decision in 1942. After that the Supreme Court abandoned patent exhaustion jurisprudence for sixty-five years. Univis sold patented, unground lens blanks for making bifocal eyeglasses, together with a license for a process patent for grinding them. The sales agreement required resellers of the finished lenses to sell them at a stipulated minimum price. The Court held that the condition was unenforceable under the first sale doctrine, but also that it violated the Sherman Act. While the Court cited the principal patent exhaustion cases, it followed the *Motion Picture* case and omitted the distinction between conditional and unconditional sales. The Court’s 2008 *Quanta Computer* decision was insufficiently clear about the condition requirement, but *Impression Products* categorically rejected it. In his opinion for the Court in *Kirtsaeng*, Justice Breyer also expressly tied copyright exhaustion policy to antitrust policy.

One feature of the antitrust rationale for exhaustion is that it does not treat the “sale” of the patented good as important. That is, if antitrust doctrine applies at all, it applies to both contract enforcement and to conditions attached to the sale of patented goods. Section 3 of the Clayton Act makes this clear with its use of “condition or understanding” as the relevant term signifying agreement. Further, the Clayton Act expressly references leases as

---

88 *Id.* at 517 (“…We are confirmed in the conclusion which we are announcing by the fact that since the decision of Henry v. A. B. Dick Co. supra, the Congress of the United States, the source of all rights under patents, as if in response to this decision, has enacted a law making it unlawful for any person engaged in interstate commerce ‘to lease or make a sale…[quoting §3 of the Clayton Act]).

89 *Id.* at 519-520 (“Generally speaking, the measure of a condition is the consequence of a breach, and if that consequence is one that the owner may impose unconditionally, he may impose it conditionally upon a certain event.”).

91 The next Supreme Court decision was *Quanta Computer*, Inc. v. LG Electronics, Inc., 553 U.S. 617 (2008).

92 *Id.* at 637.

93 See *Impression Products*, Inc. v. Lexmark Intern., Inc., 137 S.Ct. 1523 (2017) (“We conclude that a patentee's decision to sell a product exhausts all of its patent rights in that item, regardless of any restrictions the patentee purports to impose or the location of the sale.”).

well as sales.95 Beginning with *Motion Picture Patents*, §3 of the Clayton Act has been applied to both patented and unpatented goods, and to both leases and sales.96

Of course, if patent exhaustion applied only to restraints that violated the antitrust laws anyway, then there would be little independent need for an exhaustion doctrine. The antitrust laws would already be doing by statute what the patent exhaustion rule was intended to do. In any event, this is not the law under *Impression Products*. That decision refused to enforce a variable proportion tying restriction that antitrust law today would very likely approve, particularly given the lack of any evidence that Lexmark possessed market power. Exhaustion applies to any post-sale restraint, even one with no anticompetitive or anti-innovation consequences whatsoever.

Also worth noting is that turning practices such as patent ties into antitrust violations considerably broadens enforcement, enabling the government or private plaintiffs to challenge the practices directly rather than wait for a patent infringement suit. Prior to *Univis*, patent exhaustion appeared only as a defense to an infringement or contributory infringement action. There was no private right to sue a patentee for violation the exhaustion rule. A Declaratory Judgment action might possibly have worked,97 but the federal statute authorizing them was not passed until 1934.98 By contrast, *Univis* was an antitrust enforcement action brought by the United States to restrain enforcement of the post-sale condition in question as unlawful resale price maintenance. Even if the Court had not applied exhaustion the defendant would have lost on antitrust grounds.

**F. Policing Restraints on Alienation**

The *Impression Products* decision drew its rationale for exhaustion almost exclusively from the common law’s hostility toward restraints on alienation. The Court closely tracked Justice Breyer’s opinion in the

---

95 *See* 15 U.S.C. §14 (2012): “It shall be unlawful … to lease or make a sale or contract for sale of goods … on the condition, agreement, or understanding that the lessee or purchaser thereof shall not use or deal in the goods … of a competitor. . . .”

96 *E.g.*, International Business Machines Corp. (IBM) v. United States, 298 U.S. 131 (1936) (applying §3 to defendant who leased its computing machines and required lessee to purchase paper data cards from itself); United Shoe Mach. Corp. v. United States, 258 U.S. 451 (1922) (applying §3 of Clayton Act to tying clauses in leases of shoe machinery).

97 *But see* Continental Automotive GmbH v. iBiquity Digital Corp., 2015 WL 859569 (N.D.II. Feb. 26, 2015) (Declaratory Judgment action cannot be brought against a practice that does not arise under federal law, but that is asserted only as a defense).

The *Kirtsaeng* decision, which had applied the same reasoning to copyright exhaustion. Both decisions relied principally on two common law sources. One was Lord Coke’s early seventeenth century treatise, *Institutes of the Lawes of England.* The other was the writings of John Chipman Gray, a Harvard Professor, close friend of Holmes, and eminent authority on common law restraints on alienation.

Gray had actually written two important legal treatises dealing with restraints on property. One was *Restraints on the Alienation of Property,* and the other was *The Rule Against Perpetuities.* The fact that he wrote two rather large books on the subject suggests that the legal rules governing restraints on alienation were significantly more nuanced than the patent exhaustion cases describe them. In fact, there was no simple rule that all restraints on alienation, even on personal property, were unenforceable. Rather, the legal status of the restraint depended on a number of things, such as the type of property, whether real or personal; the nature of the interest being conveyed, whether vested or contingent; the length of the term of the underlying conveyance; the nature of the restraint; and the duration of the restraint itself. Further, only a subset of restraints were on “alienation” as such, although many more might affect market value.

For example, Gray wrote a section in *Restraints on Alienation* on restraints what were “Qualified as to Time,” indicating that many time-limited restraints were approved. This is important because patent law’s exhaustion doctrine applies to enforcement via patent infringement actions, which ordinarily can be maintained only against conduct that occurred during the life of the patent. So by definition the time limit is fairly short -- less than twenty years in the typical case, and certainly short by the standards of the common law. The common law rule against perpetuities as Gray famously stated it, was that “no interest is good unless it must vest, if at all, not later than twenty-one years after some life in being at the creation of the interest.” A skilled drafter could tie up property for a century or more under the rule. Gray suggested a shorter rule for express restraints on

104 For example, a grant that kept an interest in the family “until twenty years following the death of the survivor of my three grandchildren, Peter, Paul, and
alienation, which is that the condition, “if broken at all must have been broken in the lifetime of the first taker.” 105 He also discussed several cases, however, approving restraints that lasted into the second generation. 106 With respect to United States law, Gray found a great deal of controversy over the legal effect of restraints “confined to a limited period,” with a majority stating that they were good. 107 Gray himself believed that a more restrictive rule was better. 108 This is not the place to rehearse the common law of restraints on alienation of property. Clearly, however, a blanket rule that any sale of a patented article forecloses subsequent enforcement of a restraint shorter than twenty years is an egregious exaggeration of the common law’s position. 109 Further, only a small subset of the restraints to which patent exhaustion has been applied are properly classified as restraints on “alienation.” Most of them are more properly described as use limitations, governing such things as limitations to a single use, 110 limitations on the types of components with which the restrained product may be used, 111 or territorial limitations on where a product can be used. 112 The particular restriction that comes closest to a restraint on alienation is resale price maintenance clauses, which specify the minimum price at which a restrained good can be resold. 113 Even these,

Mary…” would restrain alienation until twenty years after the last of these three grandchildren died. If Mary, the survivor, was three at the time the interest was created and lived to be 93, the interest would have been tied up for 90 + 20, or 110 years.

105 Gray, Restraints, supra note 100, §47, at 34.
106 Id. E.g., Pearson v. Dolman, L.R., 3 Eq. 315 (1866) (upholding a restraint on alienation of a fund for which alienation was restrained until the grantee turned twenty-five, even though the grantee died prior to his twenty-fifth birthday).
107 Gray, Restraints, supra note 100, at § XX].
108 Id. at §54.
109 The copyright rule may be more justifiable, given the Copyright Act’s current duration of life of the author plus 70 years for most sole authored works. 17 U.S.C. §302 (2012).
112 Adams v. Burke, 84 U.S. 453 (1873) (territorial limitation; struck down).
however, are not prohibitions on alienation but rather limitations on the price of alienation. Indeed, resale price maintenance is imposed only on resellers, thus contemplating that the product is going to be resold.

In sum, *Impression Products*, *Kirtsaeng*, and other cases that have adopted a restraint on alienation approach to exhaustion are not following anything resembling the common law on the subject. Rather, they are fashioning a much more draconian federal common law governing post-sale restraints on patented articles, categorically barring them.

Fashioning a new federal common law of restraints on alienation is not what *Impression Products* and *Kirtsaeng* purport to be doing, however. Rather, *Impression Products* defined the exhaustion rule as “mark[ing] the point where patent rights yield to the common law principle against restraints on alienation.” *Kirtsaeng* did very much the same thing.

Using the common law of restraints on alienation to justify the draconian *Impression Products* rule also flies in the face of more than a century of development in the antitrust law of restricted distribution. Antitrust courts historically cited a policy against restraints on alienation to justify harsh, per se rules condemning vertical practices such as resale price maintenance and vertical nonprice restraints. For example, the 1911 *Dr. Miles* decision cited the same two sources as *Impression Products*, Coke and Gray, identifying a policy against restraints on alienation as justifying the now overruled per se rule against resale price maintenance. In its *Leegin* decision overruling *Dr. Miles*, the Court briefly traced out the changing attitudes toward restricted distribution that had made the *Dr. Miles* rationale obsolete.

In its quickly overruled *Schwinn* decision the Court also stated a policy against restraints on alienation, citing Coke as justifying a per se rule against vertical territorial restraints. *Schwinn* expressly linked the concern with restraints on alienation in order to prevent “open[ing] the door to

---

114 Gray’s own position on price restraints was more benign. See GRAY, RESTRAINTS, supra note 100, §81 (observing cases that upheld restraints that required rights of first refusal to specified buyers willing to match the price).

115 *Impression Products*, 137 S.Ct. at 1531.

116 See, e.g., *Kirtsaeng*, 133 S.Ct. at 1363 (“The ‘first sale’ doctrine is a common-law doctrine with an impeccable historic pedigree”).

118 *Leegin*, 551 U.S. at 889-890.

exclusivity of outlets and limitation of territory….” In his dissent Justice Stewart accused the Court of embracing a common law rule “merely on grounds of its antiquity.” There is much to be said for Stewart’s observation. Coke’s doctrine grew out of a classical regime in which relatively small producers were seen as placing goods on the market unrestricted, and these then passed anonymously from hand to hand until they ended up with consumers. Modern distribution systems that involve complex products, dedicated aftermarket parts, warranty and ongoing customer service, and brand specificity and trademark licensing were simply not a part of that picture. As Justice Stewart complained:

Centuries ago, it could perhaps be assumed that a manufacturer had no legitimate interest in what happened to his products once he had sold them to a middleman and they had started their way down the channel of distribution. But this assumption no longer holds true in a day of sophisticated marketing policies, mass advertising, and vertically integrated manufacturer-distributors…. “the state of the common law 400 or even 100 years ago is irrelevant to the issue before us: the effect of the antitrust laws upon vertical distributional restraints in the American economy today.”

When the Supreme Court reversed itself a decade later, placing vertical nonprice restraints under the rule of reason, it disclaimed the Schwinn Court’s reliance on a policy against restraints on alienation as “both a misreading of legal history and a perversion of antitrust analysis.”

No good reason exists why the appropriate rule for patent policy should be any different than the rule for antitrust policy. Indeed, one phenomenon that has accompanied the rise of restricted distribution systems is the significantly increased use of all types of intellectual property rights, both to protect innovation and to create product differentiation. It should not be the purpose of exhaustion doctrine to interfere with efficient distribution unless there are compelling, offsetting reasons. All the more, given that the exhaustion rule is entirely judge made.

III. Implications and Reach

The per se exhaustion rule is a poor fit for an economy in which restricted distribution has become the norm, at least for branded,

---

120 **Schwinn**, 388 U.S. at 380.
121 *Id.* at 391 (Stewart, J., dissenting).
122 *Id.* at 392 (Stewart, J., dissenting).
manufactured goods. To be sure, most distribution restraints can be and are enforced by contract law. As *Impression Products* itself reveals, however, some situations are exceptional. To the extent contract enforcement is inadequate to achieve distribution efficiency the *Impression Products* rule may operate so as to make some types of socially useful distribution unworkable. On the other side, there are some circumstances in which enforcement actions against those not in privity of contract are undesirable. This makes exhaustion a good candidate for something resembling “rule of reason” treatment. The hard part, of course, is identifying those factors that favor enforcement from those that disfavor it.

This section briefly examines some areas that might be affected by the *Impression Product* decision, and one possible means of evading it, at least for tying arrangements.

### A. Standards Essential Patents – Reversal of Incentives

Most patentees want their patents to be construed as broadly as possible, for this will widen the infringement net. The hard exhaustion doctrine expressed in *Impression Products* may change this in certain cases, however. A patentee may have an incentive to argue that its patent does not read on a particular product that it sells in order to avoid exhaustion. That effect has already shown up in the ongoing litigation between Apple and Qualcomm.¹²⁴

Suppose that a microchip maker sells a chip to a buyer and also owns a patent that reads on that chip. The chip purchaser then receives an implied license to practice this patent to the extent of using the chip for its ordinarily intended purpose, which almost certainly includes installation in a device together with other technology. If the patentee attaches a patent notice to the chip tying complementary products or limiting the components with which the chip can be used, *Impression Products* would prevent that restriction from being enforced by means of a patent infringement suit.¹²⁵

Suppose, however, that the patent does not read on the chip at all, but that the chip purchaser later uses the chip in combination with other technology or processes that might infringe that patent. Exhaustion does not apply because no relevant patented article has been sold. Further, the patentee might refuse to license the patent unless the licensee takes certain tied products or observes an exclusive dealing restriction. Those provisions would be subject to antitrust scrutiny, but the challenger would have to show

---

¹²⁵ While *Impression Products* concerned tying, Quanta Computer, Inc. v. LG Electronics, Inc., 553 U.S. 617 (2008) involved restraints on the components with which the patented product could be used.
that they are anticompetitive. Patent infringement would also be possible if the patentee could establish that the way in which the chip was used infringes its patent, but the sale of the chip itself would not exhaust it. In sum, the patentee may be considerably better off if its patent does not read on the chip in question.

The Supreme Court has addressed such situations, generally ignoring the exhaustion doctrine. In *Leitch* the patentee sold an unpatented asphalt emulsion for use in building roads, together with a patented process for applying it. It claimed that the compound was not commercially viable without the patented process and brought suit against someone who sold the emulsion. Justice Brandeis’ decision for the Supreme Court refused to enforce the restriction, but without any reference to exhaustion. Rather, he concluded that this was an attempt by a patentee of the process to extend it to cover the unpatentable emulsion.126

Responding to such decisions, Congress added §271(c) to the 1952 Patent Act. That provision stated that someone who sells a “material or apparatus for use in practicing a patented process” can be guilty of contributory infringement if the seller knew that patent infringement was intended and if the material or apparatus is “not a staple article or commodity of commerce suitable for substantial noninfringing use.”127 In *Dawson Chemical* the Supreme Court then held that someone who sold an unpatented herbicide and also owned a patent on the only known means of application could lawfully bring an action for contributory infringement against a seller who knew that the purchaser would apply it by infringing the application patent.128 The Court did not discuss patent exhaustion because no sale of a patented product was in issue.129

In sum, the sale of a good that embodies a patent exhausts that patent

Co.* (Mercoid I), 320 U.S. 661 (1944) (similar; Justice Douglas’ opinion referenced some exhaustion decisions, including *Adams* and *Motion Picture Patents*, but only for the proposition that patents must be limited to the terms of the grant; *id.* at 665).

128 *Dawson Chemical Co. v. Rohm and Haas Co.*, 448 U.S. 176 (1980). The contributory infringement defendant sold the unpatented chemical in a container that bore instructions for its application, and following the instructions effectively practiced the plaintiff’s method. *Id.* at 186.

129 By contrast, in *Univis* the patentee owned patents that covered both the bifocal lens blanks at issue and the process for grinding them. As a result exhaustion applied. See *United States v. Univis Lens Co.*, 316 U.S. 241, 246-247 (1942). Because the blanks were covered by patents the sale of the blanks exhausted those patents. See 10 PHILLIP E. AREEDA & HERBERT HOVENKAMP, ANTITRUST LAW ¶¶1782d (4th ed. forthcoming 2018).
as to that good. By contrast, if the good itself is not covered by a patent but some complement to the product is, then patent infringement might apply.\textsuperscript{130} The impact will undoubtedly be to complicate a firm’s calculus in deciding whether to declare that a patent is “standards essential.” Under the operating rules of most standard setting organizations individual participants declare which of their patents are standards essential.\textsuperscript{131} Until litigation arises that decision is ordinarily subjected to very little review. That is, for the general run of SEPs no one does a thorough vetting of the patent in order to determine that it really is essential. Further, no one typically enquires into validity, and non-litigation related searches are uncommon.\textsuperscript{132}

The question whether to declare a patent “standard essential” involves a tradeoff. By making the declaration the patentee is presumptively entitled to participate in FRAND royalties, but under the FRAND agreement it must also agree to license the patent on reasonable and nondiscriminatory terms and also to license all takers under the standard, whether or not they are competitors. Further, FRAND will very likely limit the size of the royalties. If the patentee withholds a relevant patent from a SEP declaration, however, then it will always be able to file an infringement action against any infringer and obtain whatever damages the court orders, but it would have to prove both validity and infringement, and that the patent was not exhausted by sale of a good. Notwithstanding these tradeoffs, however, it appears that “over declaring” of SEPs is relatively common\textsuperscript{133} as Apple alleges of Qualcomm.\textsuperscript{134}

It might be possible for a patentee to show both that a particular patent was standards essential to a particular technology, but also that this particular patent did not read on a particular device intended for the standard in question. That is, the fact that a patent has been declared essential does not necessarily mean that it is essential for every implementation of a particular standard.\textsuperscript{135} The two products might be perfect or at least strong complements. For example, one needs both a toaster and bread to make toast, but the sale of a loaf of bread would very likely not exhaust a patent on the

\textsuperscript{130} Assuming, of course, that it is not also exhausted by sale of the complement.

\textsuperscript{131} See CYBER CREATIVE INSTITUTE CO. LTD., EVALUATION OF LTE ESSENTIAL PATENTS DECLARED TO ETSI (June 2013), http://www.cybersoken.com/file/lte03EN.pdf.

\textsuperscript{135} See id., ¶35.
heating element of the toaster.

According to allegations by the Federal Trade Commission and Apple, many of which Qualcomm disputes, Qualcomm is attaching tying and quasi-exclusive dealing obligations to its technology, most of which is subject to patents that it has also declared to be standards essential. To the extent it is seeking to enforce these restrictions via patent infringement suits against manufacturers using devices reading on its SEPS, however, exhaustion very likely prevents it from proceeding. At this writing the litigation is in the pleading stage.136

B. Exhaustion, Tying, and Misuse

Historically patent exhaustion was liberally applied to patent ties, provided that the tying product was sold.137 In these cases the infringement plaintiff, as in Impression Products, sold a patented tying product (whether projector, ice box, or phonograph) subject to a license condition requiring the purchaser to use the patentee’s tied product (films, dry ice, or phonograph needles). These cases simultaneously found both exhaustion and became the historical basis for the development of the patent “misuse” doctrine.

The patent “misuse” doctrine eventually went further than simple exhaustion. Under the exhaustion rule the patentee could not enforce a post-sale restriction on a patented product once the product had been sold. The unanimous Supreme Court decision in Suppiger went much further.138 Suppiger owned patents on a machine that injected salt into canned food as it was being processed. It also required lessees of its machines to use its own salt tablets.139 Exhaustion would have prevented it from enforcing that tie by an infringement action against purchasers, although not lessees, of the machine. The infringement suit in question was not one against users to enforce the tying condition, however. Rather, it was a straightforward patent infringement action against a rival who had made an infringing machine. The infringement defendant successfully argued that as long as Suppiger was misusing its own patents by tying it could not enforce these patents against anyone – not even against someone who was not affected by the tie. Further,

136 Judge Koh has refused to dismiss the FTC’s complaint, which was brought under Sherman Act standards. FTC v. Qualcomm, Inc., 2017 WL 2774406 (N.D. Cal. June 26, 2017).
138 Morton Salt Co. v. G.S. Suppiger Co., 314 U.S. 488 (1942). The Court was unanimous except for the first Justice Roberts, who did not participate.
139 Morton Salt, 314 U.S. at 491-492.
patent exhaustion did not appear to apply for two reasons. First, the machines were leased rather than sold. Second, the infringement action was not one to enforce the tying condition. Nevertheless, the Supreme Court held that the situation was “fundamentally the same” as those cases implicating patent exhaustion.\(^{140}\) The Seventh Circuit below had approved the infringement suit after finding that the tie did not violate §3 of the Clayton Act because it did not substantially lessen competition.\(^{141}\) In reversing, the Supreme Court found it unnecessary to decide the Clayton Act question because both “misuse” and patent exhaustion applied so as to defeat the tying restriction.\(^{142}\)

Five years after Suppiger the Supreme Court expanded Clayton Act antitrust liability to reach a similar tie, effectively eliminating the market power and effects requirements by holding that market power could be presumed from the simple fact that the salt injecting machine was patented.\(^{143}\) This combination of exhaustion, misuse and antitrust enabled an aggressive anti-tying regime that condemned competitively harmless ties for a half century. In 1988 Congress pushed back with the Patent Misuse Reform Act, of which more below, and more recently the Supreme Court overruled the International Salt presumption of market power from the existence of a patent.\(^{144}\) Impression Products represents a course reversal, once again making a certain class of patent ties unenforceable per se.

C. Tying and the Patent Misuse Reform Act

One provision in the Patent Misuse Reform Act, enacted in 1988, was intended to permit patent owners to enforce patent ties unless they are shown to be anticompetitive. Relying heavily on that Act, the Supreme Court’s Illinois Tool Works decision reversed the market power presumption of International Salt, thus limiting antitrust illegality to situations where market power can be shown by traditional means.\(^{145}\) So the Act clearly reduced the reach of both “misuse” doctrine and antitrust to such ties. But what about exhaustion? The Supreme Court ignored the statute in Impression Products.

The Patent Misuse Reform Act embraces a “conditional” approach to patent ties, similar to the one that the Impression Products decision rejected.\(^{146}\) Section (d)(4) of that statute provides that no patent owner shall

\(^{140}\) Id. at 406 (citing numerous patent and copyright exhaustion cases).

\(^{141}\) Morton, 314 U.S. at 490, referring to G.S. Suppiger co. v. Morton Salt Co., 117 F.2d 698 (7th Cir. 1941).

be denied relief in an infringement or contributory infringement lawsuit because it conditioned … the sale of the patented product on the … purchase of a separate product … , unless, in view of the circumstances, the patent owner has market power in the relevant market for the patent or patented product on which the license or sale is conditioned.”

Section (d)(4) applies only to tying arrangements, but it unambiguously provides that a person who conditions the “sale” of a patented product on the buyer’s purchase of a second product may enforce that requirement by means of a patent infringement action, at least so long as the patent holder has not been shown to have market power in the primary product.

The Impression Products Court did not consider whether §271(d)(4) operated as an exception to patent exhaustion for tying arrangements, however, very likely because the language of the statute does not fit very well with what Lexmark did in that case. It did not require purchasers of its patented printers to purchase its patent cartridges. Rather, it required a certain class of customers to return their empty cartridges to Lexmark and forbade others from refilling them. The result of this policy, if completely effective, would have been to steer Lexmark printer users to Lexmark cartridges, but to the extent the statutory language contemplates an express tying condition the Lexmark condition did not reveal it.

Nevertheless, Lexmark might have avoided the Impression Products result simply by writing a somewhat different condition, designed to fall within §271(d)(4). If it had fixed a notice to each printer and each cartridge to the effect that use of anything other than original equipment Lexmark cartridges in the printer constituted patent infringement, that provision would have fallen within §271(d)(4) and been immune from exhaustion challenge. Under a different provision of §271, a refiller would be guilty of contributory infringement, provided that the refilled cartridge was not capable of substantial noninfringing uses.

\[147 \text{Id. at §271(d)(4).} \]
\[149 \text{That act would be covered by 35 U.S.C. §271(c) (2012):} \]

Whoever offers to sell or sells within the United States or imports into the United States a component of a patented machine, manufacture, combination or composition, or a material or apparatus for use in practicing a patented process, constituting a material part of the invention, knowing the same to be especially made or especially
IV. Conclusion: Reasonable Patent Exhaustion

An important difference between patent exhaustion and antitrust rules on restricted distribution is the method of enforcement. While federal antitrust law applies to both contract enforcement and enforcement via infringement actions, the exhaustion rule applies only to the latter. There may be good reasons for adopting narrower rules for infringement actions, which can reach people not in privity of contract. Nevertheless, that does not justify a per se prohibition such as the one the Court adopted in *Impression Products*. In some circumstances enforcement via infringement suits may be a more efficient way of organizing distribution than enforcement by breach of contract actions. Fashioning an appropriate rule requires appreciation of just how many such situations there are, as well as the social cost of a rule that is too harsh or too lenient.

In addition, patent law may have concerns that reach beyond antitrust law. As a result, the *Mallinkrodt* rule permitting infringement actions upon a clearly stated condition unless the condition constitutes an antitrust violation or patent misuse seems excessively tolerant.150 For example, infringement suits can catch the unaware by surprise. This can be remedied by requiring effective and timely notice.151 Overbroad enforcement rights may lead to splintering of royalty obligations, producing high transaction

adapted for use in an infringement of such patent, and not a staple article or commodity of commerce suitable for substantial noninfringing use, shall be liable as a contributory infringer.

See, e.g., Dawson Chemical Co. v. Rohm and Haas Co., 448 U.S. 176 (1980); Lucent Tech., Inc. v. Gateway, Inc., 580 F.3d 1301, 1320-1321 (Fed. Cir. 2009) (finding contributory infringement when defendant’s complementary product did not have substantial noninfringing uses); see also i4i Ltd. Partnership v. Microsoft Corp., 598 F.3d 831, 851 (Fed. Cir. 2010) (similar), aff’d on other grounds, 564 U.S. 91 (2011).

costs and double marginalization.\textsuperscript{152} Effects may differ depending on the type of remedy that the patentee is able to obtain, whether damages or an injunction. Some conditions apply only once, typically to end users, while others get passed down the distribution chain. As a general proposition none of these effects violates the antitrust laws, even though they might reduce economic welfare.

Even the duration issue is less categorical and more complex than first appears. As noted previously, the common law was generally more willing to enforce restraints that were limited in time. One must always ask, however, time in relation to what? A 100 year restraint such as the rule against perpetuities might permit seems relatively short in relation to family interests in estates in land. By contrast, a use restraint on a reusable printer cartridge that lasts for the remaining life of its patents – say, 10 years –may be as good as forever. The question is the relationship between the duration of the restraint and the life expectancy of the product to which it applies. Some post-sale restraints, such as the restrictions on re-use or refilling in \textit{Mallinkrodt} and \textit{Impression Products} operate effectively for the life of the product to which they are attached. They operate by shortening the usable life of the product.

The best way to address these problems is not through antitrust law but rather by development of a federal common law of post-sale patent restraints that is more nuanced than is reflected in existing Supreme Court doctrine, but that reaches further than antitrust. The fact that the restraints come in a large variety suggests that a common law judge made approach would be better than a statute. The suggestions offered here are not intended to be exhaustive, but rather illustrative of the fact that post-sale restraints come in many different kinds, with differing effects on welfare, competition, or innovation. To the extent manageable, an effective set of enforcement rules for such restraints must take these differences into account. In the process it would make patent law more sensitive to the variety of market situations in which patents are licensed.

One important consideration in the development of such doctrine is the effect of the distribution restraint when enforcement is limited to breach of contract suits. When simple contract enforcement is likely to satisfy the patentee’s legitimate distribution needs, the case for enforcement via infringement actions is less important. Accordingly, a court can feel free to apply exhaustion. This query would result in exhaustion in many but not all situations. For example, in \textit{Impression Products} itself the Court acknowledged that contract enforcement mechanisms were inadequate.\textsuperscript{153} In

\end{itemize}
\end{footnotesize}
that case application of exhaustion was ill advised without a showing that some other harm to competition or innovation was in prospect.

Contractual enforcement of resale price maintenance rules, another frequent subject of exhaustion litigation, is usually accomplished quite easily, at least in two stage distribution systems. Cheating sales are ordinarily detectable. Prices must be advertised in order to be effective, and rival dealers can be trusted to complain. In sum, violations of resale price maintenance provisions are generally easier to detect than violations of tying arrangements imposed on consumers. As a result, the effectiveness of contract law suggests that the courts can feel freer to apply exhaustion.

Restrictions on the resale of exported and re-imported goods, relevant in both *Kirtsaeng* and *Impression Products*, raise different issues. Sellers often engage in third degree price discrimination as between domestic and foreign sales – a strategy that can be frustrated by arbitrage. For example, Kirtsaeng might purchase books at a low price in Asia in order to import and resell them in the United States at a much higher price. Third degree price discrimination can increase welfare if it increases output, and in many such cases the foreign sales are an output increasing strategy. That is, consumer elasticity of demand is higher in the foreign country and the seller can make those sales only at the lower price, but it need not reduce domestic sales in order to make the foreign sales. In that case the best economic policy is to permit the IP rights holder to discriminate. An immediate purchaser from the publisher would have privity of contract, so an infringement suit would be unnecessary. Detection might be an issue, but not one that would distinguish infringement actions from contract actions. A purchaser two or three steps removed would not have privity, however. Of course a notice restricting resale territories could readily be placed inside the book, effectively communicating it to more remote resellers.

---

156 *Kirtsaeng* v. John Wiley & Sons, Inc., 568 U.S. 519, 526-527, 133 S.Ct. 1351, 1356-1357 (2013) came up on peculiar facts. Kirtsaeng asked friends and relatives in Thailand to purchase books overseas at the lower price and mail them to him while he studied in the United States. He then resold the books on eBay or other websites. In that case the publisher and Kirtsaeng were not in privity.
157 *Cf.* Bobbs-Merrill Co. v. Straus, 210 U.S. 339, 341 (1908). The restriction was printed in each copy of the book just behind the title page:

“The price of this book at retail is $1 net. No dealer is licensed to sell it at a less price, and a sale at a less price will be treated as an
Thus an important requirement of any federal common law of post-sale patent restraints should be effective and timely notice to prospective infringers. Although patent infringement does not require that the infringer have prior notice of infringement or even of the patent’s existence, that is hardly the same thing as notice of a particular restriction that has been imposed in a patent license. To the extent a post-sale restraint is likely to catch infringement defendants who are unaware, enforcement should be denied. By contrast, if notice is given and effective to all downstream parties, including those not in privity with the rights holder, then enforcement is more appropriate.

Federalism concerns may also be appropriate when a post-sale restraint creates inconsistency with state law. Under the Supremacy Clause the requirements for federal patent infringement trump inconsistent state law, but a judge made common law of post-sale restraints could apply comity so as to give state law due regard. For example, the manufacturer of a patented outdoor grill might impose a condition charging purchasers a higher price if they do not use its own refillable propane tanks. But those tanks may be banned by the state as dangerous. A federal court might well apply common law powers to hold that such an enforcement action pushes the federal law of patent infringement too far into territory that should be reserved to the states.

Lest this strike some as inconsistent with the Supremacy of federal law, it is worth noting that federal antitrust policy makes these tradeoffs this all the time. For those activities in or affecting interstate commerce the Sherman Act could trump thousands of state measures that regulate rates or exclude certain firms from markets. But antitrust policy does not follow a course of knocking all state economic regulation to the side. Instead it looks for ways to make federal antitrust policy work in tandem with state regulation. That entails that sometimes federal supremacy reigns, but in other cases state or local regulation prevails. Further, the set of rules that makes infringement of the copyright.

The Bobbs-Merrill Company.”

Such a notice, unless removed, would be warning to anyone downstream, no matter how removed from the publisher. The foreign-distributed Wiley books in *Kirtsaeng* also contained a printed notice in each foreign-sold book restricting the location of sale. See 133 S.Ct. at 1356.

158 For a survey of such situations, see 1 Phillip E. Areeda & Herbert Hovenkamp, *Antitrust Law*, Ch. 2B (4th ed. 2013); *Id.*, Ch. 24 (3d ed. 2012). *See also* Wayne D. Collins, *Trusts and the Origins of Antitrust Legislation*, 81 *Fordham L. Rev.* 2279, 2340 (2013) (“the backers of the Sherman Act assured the floor of the Senate that they were merely seeking to enable federal courts to apply the common law to anticompetitive business activities and early federal cases are
these determinations – principally the “state action” doctrine\(^{159}\) – are essentially judge made and highly fact specific.

The *Impression Products* patent exhaustion rule is a blunt instrument in relation to the justifications offered for it. In its favor, a rule of per-se-exhaustion-upon-sale is simply stated and perhaps easily understood.\(^{160}\) Because it is so categorical, however, it fails to distinguish harmful from beneficial uses of post-sale restraints. The antitrust law of restricted distribution began in a similar place, adopting categorical per se rules that eventually gave way to more nuanced treatment under the rule of reason as our understanding of the economics of restricted distribution changed. Even a quick examination of the types of restraints imposed in exhaustion cases indicates that they are used for many different purposes and with different effects. Current exhaustion doctrine is wrong to make these differences irrelevant.

\(^{159}\) See AREEDA & HOVENKAMP, *id.*, Ch. 1A, Ch. 2B-3.

\(^{160}\) But see Straus v. Victor Talking Mach. Co., 243 U.S. 490, 498, 500-501 (1917), in which the patentee attempted to evade the first sale doctrine by nominally “licensing” phonograph machines to dealers, who were authorized to relicense them to consumers even though the transactions bore all the indicia of a sale, including assignment of all risk of loss or nonsale to the acquiring dealers. Further, the “royalty” stipulated in the agreement was an upfront lump sum of $200, suggesting that it was a disguised sale. The Court concluded that:

> Courts would be perversely blind if they failed to look through such an attempt as this ‘License Notice’ thus plainly is to sell property for a full price, and yet to place restraints upon its further alienation, such as have been hateful to the law from Lord Coke's day to ours, because obnoxious to the public interest.

The case involved both resale price maintenance and tying. On the latter, users were required to use only needles and phonograph records supplied by Victor. This suggests that Victor very likely had an enforcement problem similar to the one that the Court recognized in *Impression Products*. See discussion *supra*, text at notes __.
