The Problem of Sunsets
Jill Fisch
Steven Davidoff Solomon*

Abstract

An increasing percentage of corporations are going public with dual class stock in which the shares owned by the founders or other corporate insiders have greater voting rights than the shares sold to public investors. Some commentators have criticized the dual class structure as unfair to public investors by reducing the accountability of insiders; others have defended the value of dual class in encouraging innovation by providing founders with insulation from market pressure that enables them to pursue their idiosyncratic vision.

The debate over whether dual class structures increase or decrease corporate value is, to date, unresolved. Empirical studies have failed to provide conclusive evidence as to the effect of dual class structures, and calls for regulators or stock exchanges adopt prohibitions banning dual class structures outright have been unsuccessful, although several index providers have banned dual class stock from major indexes such as the S&P 500.

As a result, some commentators have advocated a compromise position permitting corporations to go public with dual class structures but requiring that they be required to include mandatory time-based sunset provisions. The sunset provisions would automatically convert the dual class structure to a single share structure after the passage of a pre-determined period of time. The Council of Institutional Investors has asked the New York Stock Exchange and Nasdaq to refuse to list the shares of dual class firms unless they contain a time-based sunset provision that would convert within seven years.

We do not take a position on whether dual class structures are value-enhancing, but we challenge the proposition that time-based sunsets are an appropriate response to the debate over dual class and that they should be imposed through regulation or stock exchange rules. To the extent that dual class structures are problematic, sunsets do not solve that problem. Moreover, time-based sunsets are an arbitrary response to the concern that developments such as the decline in a founder’s economic interest or the transfer of high-vote shares to third parties may reduce the attractiveness of the dual class structure. In addition, time-based sunsets create potential moral hazard problems. We further argue that the limitations of time-based sunsets cannot be addressed through a retention vote by the minority shareholders due to the problematic incentives of the minority shareholders.

We observe that event-based sunsets, which have received less attention, focus on the specific developments that are likely to erode the potential value of dual class, and we call for market participants to explore them further through private ordering. Nonetheless, we argue that, at the present time, investors and policymakers lack sufficient information about either dual class or sunsets to justify using regulation, index requirements or stock exchange rules to force

companies into adopting sunsets. We further argue that, rather than relying compulsory sunsets to evade the difficult policy issues raised by dual class, the debate should encompass a more thorough framing of the role and importance of shareholder voting rights.

I. Introduction

The popularity of dual class voting structures in publicly-traded companies has increased dramatically in the past few years. Dual class structures provide that all the shares of the issuer’s stock have equal economic rights, but that the shares owned by the founders or other corporate insiders have greater voting rights than the shares sold to public investors. While only a handful of companies went public with dual class structures prior to 2010, the percentage of IPOs involving companies with dual class stock has skyrocketed, increasing to 19% of IPOs in 2017.1 Currently more than 10% of large companies in the S&P 500 index have publicly-traded shares with limited voting power.2

The rise of dual class stock has spurred controversy and debate.3 The Council of Institutional Investors has broadly endorsed the principle of “one share, one vote.”4 In response to concerns expressed by the Council and a number of institutional investors, several major index providers excluded dual class shares from major stock indices such as the S&P 500 index.5 Scholars argue that dual class creates the opportunity for founders to enjoy private benefits and exacerbates managerial agency costs.6 In his first speech as SEC Commissioner, Robert Jackson compared dual-class shares to “corporate royalty.”7

Despite the criticisms, some commentators defend dual class stock, arguing that it is a valuable tool that allows a founder to realize his or her idiosyncratic vision of the company without being subject to the pressure of activists and other investors for short term returns.8 In addition, dual class structures may increase the willingness of founders to take their companies public, potentially mitigating the decline in the number of public companies.9 Limiting the

6 See, e.g., Paul A. Gompers et al., Extreme Governance: An Analysis of Dual-Class Firms in the United States, 23 REV. FIN. STUD. 1051, 1051–54 (2010) (finding that dual class companies demonstrate higher agency costs and reduced firm value).
8 See, e.g., Zohar Goshen & Assaf Hamdani, Corporate Control and Idiosyncratic Vision, 125 YALE L.J. 560, 590 (2016) (arguing that dual class structures enable entrepreneurs to pursue their idiosyncratic vision but expose minority shareholders to substantial agency costs).
voting rights of transient public investors may enhance productivity, not just in start-ups but in established companies. Indeed, outside the United States, regulators and stock exchanges are modifying their rules to facilitate greater use of dual class voting structures.¹⁰

The debate over whether dual class structures increase or decrease corporate value is, to date, unresolved. The empirical evidence on the effect of dual class stock on economic value is inconclusive.¹¹ The results of empirical analysis are also subject to fundamental econometric limitations including pervasive selection effects. In the absence of definitive empirical evidence, theory and policy have dominated the discourse, and a number of proposals to ban or otherwise circumscribe the effects of dual class stock have emerged in the last few years.

The latest policy proposal—so-called sunset provisions—offers a compromise position between an outright prohibition of dual class and allowing issuers freely to adopt a “perpetual” dual class structure. Sunset provisions provide that, under stipulated circumstances, an issuer’s dual class structure automatically converts into a single class structure in which all shares have equal voting power. The inclusion of sunset provisions in the charters of dual class issuers has been defended as a way of balancing the protection of the founder’s ability to innovate with the need to minimize agency costs. As the Counsel of Institutional Investors explains in defense of its support of sunsets, “[s]ince 2016 CII has supported sunset provisions if necessary to achieve alignment over a reasonable period of time.”¹² SEC Commissioner Jackson stated that, unless the higher voting rights had a sunset provision, they were “antithetical to our values as Americans.”¹³ In support of his position that dual class companies should include sunset provisions, Commissioner Jackson reported the results of preliminary empirical analysis showing that the valuations of dual-class IPO companies with sunset provisions diverged from and exceeded the valuations of those companies with perpetual dual class stock, beginning two years after the IPO.¹⁴ Similarly, Lucian Bebchuk and Kobi Kastiel present empirical evidence that the adverse effects of dual class stock increase over time and advocate sunset provisions as a response to this problem.¹⁵

The debate over sunset provisions has focused primarily on time-based sunset provisions that eliminate higher voting rights after a designated period of time—commonly 7-10 years.¹⁶

companies as “a serious issue for our markets and the country more generally”). As Jack Coffee observes “practitioners point to recent examples of dual class IPOs, which 2018 included Dropbox, Inc., GreenSky, Inc., Pivotal Software, Inc., Pluralsight, Inc., and SmartSheet, Inc., to argue that these issuers would have remained outside the public markets if they could not have used a dual class capitalization”. John C. Coffee, Jr., *Dual Class Stock: The Shades of Sunset*, N.Y. L. J., Nov. 14, 2018, https://www.law.com/newyorklawjournal/2018/11/14/dual-class-stock-the-shades-of-sunset/.

¹⁴ *Id.*

Time-based sunsets are appealing, in part because they appear to offer a solution to the empirical findings reported by Commissioner Jackson and Professors Bebchuk and Kastiel that the potential advantages of a dual class structure decline over time.¹⁷

We question whether the current focus on sunset provisions is warranted. If dual class is a valuable tool for early-stage corporate growth in some companies, it is unclear how a bright line time limit that does not reflect company-specific needs makes sense. More generally, much of the discourse around sunset provisions is really about dual class stock itself and whether it is desirable. Time-based sunsets are better understood as a “split the baby” approach¹⁸ to the controversy over whether policymakers should permit dual class structures in public companies. We believe however that, as with many other debates over good corporate governance, a one-size-fits-all approach is overly simplistic. Dual class stock may be desirable for some companies but not others, and the continued value of dual class is likely to depend on company-specific factors that vary subsequent to the IPO. The debate about sunset provisions should therefore focus on these factors.

In this light, a sunset provision can perhaps better be understood as an insurance policy against a founder whose idiosyncratic vision turns out, in hindsight, to be flawed. But a tool that facilitates the displacement of that founder after 7-10 years – an eternity in the life of an innovative new-economy company – seems an inapposite and potentially costly mechanism. As we explain here, an arbitrary time limit that is predetermined at the IPO stage is a noisy proxy for assessing whether the desirability of retaining the dual class structure. Rather, we identify several particular issuer-specific developments that potentially erode the desirability of dual class. The most important of these developments are substantial dilution of the founder’s stake, transfer of high voting stock to a non-founder, and death, incapacitation or departure of the founder. Obviously, the passage of time increases the potential for these developments but, as we argue here, it is these developments, and not time alone, that are critical for the continued effectiveness of dual class. To the extent sunset provisions are warranted, they should incorporate these developments and any regulatory effort should be similarly focused.

We further challenge the claim that the potential downside of mandatory time-based sunsets can be remedied by enabling shareholders to vote to extend the dual class structure beyond the sunset deadline.¹⁹ Although in theory shareholders should vote to retain dual class in situations in which enhanced founder control is value-enhancing, we question whether the institutional investors who would control such a voting decision would have the appropriate incentives to vote to retain the dual class structure. We similarly highlight the perverse incentives that a time-based sunset creates for those who hold high vote stock.

In this article we attempt to reorder the debate over dual class stock, positing that dual class stock responds to the evolving reality of capital market structure in the United States and the world. In certain circumstances dual class stock may be appropriate for certain companies

---

¹⁷ See, e.g., id. at __ ("controllers have perverse incentives to retain dual-class structures even when those structures become inefficient over time.").

¹⁹ See, e.g., CII Petition to New York Stock Exchange, October 24, 2018, avail. at https://www.cii.org/files/issues_and_advocacy/correspondence/2018/20181024%20NYSE%20Petition%20on%20Multiclass%20Sunsets%20FINAL.pdf, at 6. (proposing that issuers with a dual class structure be required to have a mandatory sunset provision of seven years or less, but that issuers be permitted to allow shareholders to vote to retain the dual class structure).
particularly at the IPO stage, but in others it is not. As the private capital markets have expanded, new companies are no longer compelled to seek capital from public investors. The reduced market power of public investors requires them, in some cases, to accept diminished voice in exchange for a broader range of investment opportunities. Sunsets reflect our discomfort with this shift in the balance of power, but it is unclear that, given the current ownership structure of public companies\(^\text{20}\) that sunsets are the right tool to address dual class concerns. Instead, we should better frame what is at stake in the debate over voting rights.

### II. Background

#### A. Dual Class and Its Variants

Dual class stock refers to a capital structure in which shares of an issuer’s common stock with equal economic rights differ with respect to their relative voting power. The common stock\(^\text{21}\) in a dual class company is divided into two or more classes, in which the shares with more voting power are typically described as high vote stock, and the shares with less voting power are described as low vote stock. The precise ratio of voting power varies, but it is common for high vote shares to have ten times the voting power of low vote shares.\(^\text{22}\) Some issuers may have a third class of stock with no voting rights at all.\(^\text{23}\) Due to stock exchange restrictions, dual class structures must be implemented at the IPO stage and midstream adoptions are prohibited.\(^\text{24}\)

Founders or other early stage investors use dual class stock to retain control of the firm. At the time of the IPO, the founder or other early stage investors retain high vote shares, and the low vote shares are issued to public investors.\(^\text{25}\) The key advantage offered by the dual class structure is that it enables those who own the high vote shares to divest a substantial portion of their economic stake without losing voting control. Dual class stock thus cements control of the

---

\(^\text{21}\) Dual class common stock is distinct from issuers that have both preferred and common stock, which have different economic as well as voting rights. In such cases, it is typical for the preferred stockholders to have reduced or nonexistent voting rights and instead to have enhanced rights with respect to dividend payments or liquidation preferences.

\(^\text{22}\) Council of Institutional Investors, Dual-Class Stock, supra at note 12.

\(^\text{24}\) See infra note 29 and accompanying text.

\(^\text{25}\) Although dual class can be used in private companies, VC-funded issuers are more likely to use capital structures in which different classes of securities have varying economic rights. It does appear however, that some VC companies are adopting dual class structures prior to the IPO. See, e.g., Julia Boorstin, Facebook's New Dual Class Structure - Slow Steps to an IPO, CNBC, Nov. 24, 2009, https://www.cnbc.com/id/34134917 (citing Facebook and Google’s adoption of dual class structures prior to their IPOs). In addition, some significant private companies have eliminated dual class structures: Uber is the most notable example. Mike Isaac, Uber Shareholders Including Kalanick Loosen Grip With Sales of Stock, THE N.Y. TIMES, Jan 15, 2018, at B2.
firm with a core group of investors for an extended, and, historically, an indeterminate period of
time.

B. The Rise of Dual Class

The modern use of dual class stock dates back to 1976. In that year, Wang Laboratories
listed using dual class on the American Stock Exchange.\(^{26}\) The listing was controversial, and at
the time barred by the New York Stock Exchange.\(^{27}\) AMEX allowed the listing, but only under
terms designed to ameliorate the impact of the high vote stock.\(^{28}\) These terms included a
requirement that the low vote holders be permitted to elect 25% of the company’s directors to the
board.\(^{29}\) The Wang Laboratories IPO triggered a spate of dual class listings at the IPO stage that
continued until the 2000s.\(^ {30}\)

In 1986, in response to an effort by General Motors to retain a dual class structure in
connection with its acquisitions of Electronic Data Systems and Hughes Aircraft – a structure
that was then-barred under the listing requirements of the New York Stock Exchange – the
NYSE voted to eliminate a 60-year old rule that imposed a one-share one-vote standard on all
listed companies.\(^{31}\) The NYSE rule change required SEC approval and, rather than approving
the proposed rule change, in 1988, the SEC adopted Rule 19c-4 which, for the most part,
prohibited the creation of dual class voting structures.\(^{32}\) The D.C. Circuit struck down Rule 19c-4
as beyond the scope of the SEC’s rulemaking authority.\(^ {33}\)

In the wake of the court’s decision, the stock exchanges adopted rules that allowed dual
class stock, but only if it was issued at the IPO stage.\(^ {34}\) For a number of years following these
rule changes, use of dual class structures was limited to “businesses, media companies seeking to
ensure their publications could maintain journalistic editorial independence, or other companies
led by a strong group of insiders.”\(^ {35}\)

\(^{35}\) David J. Berger, Are Dual-Class Companies Harmful to Stockholders? A Preliminary Review of the Evidence,
dual-class-companies-harmful-to-stockholders-a-preliminary-review-of-the-evidence/.
The recent boom in dual class stock began with the 2004 IPO of Google. Google went public using a high vote (10 votes to 1) common share option designed to preserve control with the founders Sergey Brin and Larry Paige. The rationale provided at the time was spelled out in a letter to shareholders. Brin and Paige wrote that:

In the transition to public ownership, we have set up a corporate structure that will make it harder for outside parties to take over or influence Google. This structure will also make it easier for our management team to follow the long term, innovative approach . . . Google has prospered as a private company. We believe a dual class voting structure will enable Google, as a public company, to retain many of the positive aspects of being private.

The Google founders specifically noted that dual class stock was rarely used in technology companies at the time. But Google opened the floodgates, and thereafter dual class stock has become a norm for technology companies. Facebook, Linkedin and Snap have all undertaken IPOs with dual listings. In all, about half of dual class share listings since the Google IPO are of technology companies. Indeed, so common is dual class stock that when Twitter went public without it, a front page news article in the Business Section of the New York Times explicitly highlighted this fact. Figure 1 sets forth figures compiled by Professor Jay Ritter on the rise of dual class stock in IPOs. More recently, the CII reports that, in 2017, 19% of IPO companies had dual class structures. Dual class structures are also common outside the United States.
The reasons postulated for the increasing use of dual class stock vary. They include simple entrenchment,\(^{45}\) protection of the founder’s vision from divergent, less capable interests, the need for technology companies to respond to greater information asymmetries,\(^{46}\) the desire to stem short-termist interests in the capital markets,\(^{47}\) and greater market responsiveness to information (allowing more slack to founder).\(^{48}\) While the reasons vary, they are often summarized as the Google founders did -- a tool to insulate the founder and the board from people (i.e., investors) who will question, critique or impede founder’s vision.\(^{49}\) Dual class is most commonly defended as providing thick insulation of the company from outside, perhaps value-destructive interests.

Whatever the reason, today dual class structures are not just the purview of technology companies. The media industry has long utilized a dual class structure to protect themselves

from investors who might limit their journalistic integrity. And as dual class has become more common it has been utilized by grocery stores, hamburger chains, clothing manufacturers and various other companies across industries. Figure 1 shows that from 2005 to 2015, the number of IPOs employing dual class stock rose by 44%. Dual class has also spread to other countries. A 2017 ISS study found that 24% of companies in a sample involving sixteen European countries had a dual class structure.

C. The Debate Over Dual Class

The widespread use of dual class stock in a variety of different industries has sparked a furious debate over its efficacy. This debate has been carried out both in academia and public forums and has been shaped by a developing yet, to date inconclusive, body of empirical evidence.

a. Empirical Evidence

As an initial matter, some academics have argued that the IPO market offers a sufficient constraint on the inefficient use of the dual class structure. Under a traditional law and economics analysis, rational investors will take into account the potential costs and benefits of dual class at the time of the IPO. In this scenario, investors will pay less for the stock at the time of the IPO if they deem dual class harmful. Alternatively, if they view it as beneficial they will pay more. In either case, because dual class stock is “priced” policy prescriptions are unneeded. And while companies may change situations over time, in a diversified market some will do better than others meaning shareholders will earn a market return. Indeed, if market participants effectively price the potential costs associated with dual class at the IPO stage, dual class stock should be impervious to empirical analysis.

This argument assumes that markets are efficient at the IPO stage in pricing dual-class, an assumption that is highly controversial. An extensive literature argues that the IPO market is not efficient in pricing governance terms. Moreover, this argument ignores any externalized effects of dual class stock. For example, the chaos at Viacom over control of the company caused harm to employees, suppliers and other non-shareholder constituents. Even if the IPO market were efficient, this harm would go unpriced.

52 See generally Zohar Goshen and Assaf Hamdani, Corporate Control and Idiosyncratic Vision, 125 YALE L.J. 560 (2016).
55 Id.; see also Fisch et al., supra note 20 (identifying limitations of the IPO market in pricing governance terms).
The uncertain theoretical basis for valuing dual class stock is matched by unclear evidence on the effect of dual class on value.57 A number of studies of dual class firms in the era prior to Google found that dual class stock was value-decreasing.58 These studies relied on basic agency theory as espoused by Berle and Means concerning the separation of ownership and control59 and the theoretical motivation of a controller to take advantage of its differential voting and economic position to extract private benefits.60 These findings also find further theoretical justification in numerous studies outside the dual class context which find that firm value and stock market returns decrease as the divergence between voting rights and cash flow rights increase.61 Notably, however, these studies focused primarily on family-owned and media companies, which are very different from the technology companies that have adopted dual class structures more recently.62

Another conflicting strand of research has identified potential value-increasing attributes to the dual class structure.63 This literature attributes value to dual class in certain circumstances, including when there is information asymmetry between shareholders,64 or shareholders with a short term focus.65 Others have found that dual class allows firms to cement long term relationships with other constituencies and to make long-term investments.66 David Berger, a

57 See generally Anand, supra note 44 at 18-20 (summarizing empirical literature on the effects of dual class structures).

OF FIN. 537 (2004). See also Noah Wasserman, The Throne vs. the Kingdom: Founder control and value creation in startups, 38 STRAT.MGMT.J. 255 (2017)
62 Google Inc., supra note 36, at iii (noting that a dual class stock structure is “common in the media business and has had a profound importance there. The New York Times Company, the Washington Post Company and Dow Jones, the publisher of The Wall Street Journal, all have similar dual class ownership structures.”).
prominent litigator at the Silicon Valley law firm, Wilson Sonsini, defended the increasing use of
dual class stock stating that “[w]ithin this broader context the notion of dual-class stock should
be considered, as it really was developed to respond to the changing nature of our corporate
republic.”67 Other academics have also supported dual class structures. Dorothy Shapiro Lund
argues that no-vote shares can “lessen agency and transaction costs” by reducing
inefficiencies.”68 Many shareholders do not exercise their voting rights, so Lund argues that
allowing “rationally apathetic investors” to sell their voting rights would distribute voting rights
more optimally.69 Bernard Sharfman also argues that dual class shares allow private ordering to
increase value through bargaining.70

Empirical research has documented that, at least in the early years following an IPO, dual
class firms may outperform firms with a single class of stock. Cremers, Lauterbach and Pajuste,
for example, find that dual class firms outperform their single class counterparts for 7-8 years
after an IPO.71 Baran, Forst and Via find that insider control at multi-class firms has a positive
effect on innovation, at least in the early years following an IPO.72 Similarly Kim and Michaely
find that firms with multi-class structures outperform single class firms for eleven years
following the IPO.73 Most recently, an MSCI study found that issuers with unequal voting rights
outperformed the market over a ten year period.74

These studies are not only conflicting but in many cases suffer from econometric
limitations. The primary issue with finance studies of dual class stock is selection effects,
namely that the companies that select into dual class structures differ, in important ways, from
companies that adopt single class structures. More specifically companies with value decreasing
corporate governance or otherwise prone to poor performance may select into dual class
structures in order to insulate the board and executives from their poor performance. If this is the
case, dual class stock is merely a symptom of poor governance or performance and not itself
value reducing. And companies are able to implement these structures at the IPO stage due to
inefficiencies in the IPO process itself. Relatedly, companies with strong governance and value
creation mechanisms may prefer this structure in order to cement ties with other constituencies

research showing that “unequal voting stocks in aggregate outperformed the market over the period from November
2007 to August 2017, and that excluding them from market indexes would have reduced the indexes' total returns by
approximately 30 basis points per year over our sample period”).
and truly plan for the long term. In either case, no finance study has to date adequately disentangled these effects and adequately addressed this selection issue.

A second issue is time. Companies with dual class stock may have long life spans as a public firm. Dual class stock may create value in early years when the company is implementing its long-term agenda.75 However, dual class companies may suffer from value decreases in later years as the founders become distracted or future generations take control of the company. The example of Viacom where the controller Sumner Redstone has refused to give up control of the company despite being incapacitated and unable to speak is a recent example.76

In a recent paper, Martijn Cremers, Beni Lauterbach and Anete Pajuste analyze this issue. The authors find that in a sample of dual class firms matched with a single class sample from 1980-2015, dual class firms on average have a higher valuation at the IPO stage than single class firms, a premium which disappears over time.77 These findings generally align with another study of the matter by Kim and Michaely who also find that, in the early years, dual class firms have higher valuations, but in later years are less agile and dynamic.78

These studies address the time issue, but they too suffer from econometric issues. More specifically, in both studies the authors rely on matched pair analysis to address selection effects. In a matched pair analysis, a dual class company is matched with a similar non-dual class company to compare performance.79 This yields a sample of comparable firms that can then be compared on an average basis. This is an accepted technique in econometrics,80 however the quality and scope of the match always creates uncertainty. In the case of the Cremers and Kim papers we simply do not know the quality and fit of the match, particularly due to the selection issue. In addition, most studies of time-based effects focus firms prior to the Google IPO, of necessity. The Google IPO, however, changed the mix and character of dual class stock. Post-Google, dual class became more wide-spread in growth companies in the technology industry but also in areas outside the traditional use of dual class such as in the media industry. Yet most of the growth in dual class companies has occurred in the last several years, making the long term effect of these structures impossible to evaluate empirically.81 For example, Kim & Michaely study find a turning point in the value of multi-class structures eleven years after the IPO,82 but the vast majority of technology companies with dual class structures went public less than eleven years ago. Even if the econometric issues could be addressed, the use of dual class among modern companies and its widespread growth has yet to be fully examined.

b. The Policy Debate

82 Kim & Michaely, supra note 73.
The uncertain empirical evidence has fueled an increasingly heated policy debate over the use of dual class stock. On one side Commissioner Jackson has called out dual class stock for perpetuating “corporate royalty.” Similarly SEC Commissioner Kara Stein has stated that these structures are “inherently undemocratic, disconnecting the interests of a company’s controlling shareholders from its other shareholders.”

Commissioner Jackson’s arguments against dual class stock pick up a policy debate within stock markets. On the one side are those groups and institutional investors which can be described as shareholder-rights advocates. The Council of Institutional Investors has led the charge against dual class stock asserting that stock with differential voting should be barred and “every share of a public company’s common stock should have equal voting rights.” The proxy advisory services led by Institutional Shareholder Services have also denounced dual class stock. These organizations have been joined by Blackrock, State Street Corporation, and T. Rowe Price also calling for the elimination of stock with unequal voting rights.

In 2017 a new front opened in the war on dual class stock – the decision by several major index providers to limit the inclusion of issuers with dual class voting structures. The FTSE Russell decided to exclude all firms in which the public shareholders have the power to cast less than 5% of the votes in the firm. S&P Dow Jones which administers the S&P 500 among other popular indexes excluded all new dual class firms. MSCI is still considering its approach but has announced that dual class stock will receive reduced weight in its indexes. The index providers made this change at the behest of some index funds who did not feel that the dual class governance structure was appropriate. At the time, some commentators viewed the change as a back-door action in light of stock exchange inaction. Notably, not all passive investors supported this decision. BlackRock, for example, although publicly opposed to the

89 See COUNCIL OF INSTITUTIONAL INVESTORS, Letter to MSCI Equity Index Committee (Aug. 3, 2017) (“CII’s membership includes strong supporters of passive index strategies, and we believe that major index providers have a critical role to play in preventing non-voting and multi-class equity structures from gaining unstoppable momentum”).
90 Matt Levine, Listing Standards and Dividend Shares, Bloomberg View: Money Stuff (April 13, 2017) (stating that the actions of the indexes put them in a “weird role” and transgressed a “long tradition of corporate governance standards being imposed by stock exchanges as ‘listing standards’ . . .”).
dual class structure, expressed concern that excluding dual class companies from the index would deprive their index-based clients of “opportunities for return.”

The movement against dual class in the United States has been rejected outside the United States which is seeing a trend towards allowing greater use of dual class stock. In response to Alibaba’s decision to listing in the United States in order to use a form of dual class stock, the Singapore and Hong Kong exchanges amended their rules to eliminate the prohibition on dual class stock. In Europe there has been a strong move towards tenure voting, also known as loyalty shares. Loyalty shares confer greater voting rights on shareholders who hold their stock for a specified period of time and are frequently defended on the basis that, by increasing the voting power of long term shareholders, they facilitate managing the corporation with a long term perspective.

Some commentators have argued that loyalty shares offer an intermediate approach to the policy debate over dual class for two key reasons. First, because loyalty shares confer higher voting rights on any shareholder who meets the required holding period, they do not privilege the founder over public shareholders. Second, the structure of loyalty shares makes founder control increasingly contestable as the founder’s economic stake decreases relative to the holdings of outside investors. As a result, public shareholders are likely to have greater power in situations in which the agency costs associated with founder or managerial entrenchment are likely to be greatest.

Recent empirical work by Edelman, Jiang and Thomas supports this proposition. EJT model the relative voting power of founder/managers institutional investors under various assumptions and then, using these assumptions, run a series of simulations seeking to evaluate the extent to which control is contestable. They show that, although loyalty shares effectively preserve founder control when the founder retains a 20-30% economic stake, when the founder’s ownership declines to as little as 3%, outside investors obtain a meaningful opportunity to challenge founder control.

In sum, the shifting policy debate over dual class mimics the conflicting empirical evidence: there is no definitive and known truth to emerge on whether and when dual class stock is desirable.

III. The Role of Sunsets

Perhaps in response to the continuing debate over the efficacy of dual class structures, critics of dual class have shifted to a more nuanced approach. Rather than advocating an outright ban of dual class structures, these commentators increasingly argue that if a company adopts a dual class structure, that structure should be subject to a sunset provision. A sunset provision provides that, upon some pre-specified date or event, the high vote stock converts to low vote stock, effectively extinguishing the dual class structure.

Proponents of sunsets argue that they blunt the impact of the undemocratic nature of dual class. Commissioner Jackson, for example, has focused his opposition to dual class stock on “perpetual dual-class.” In a landmark speech he criticized perpetual dual class stock on the grounds that it “raises the prospect that control over our public companies, and ultimately of Main Street’s retirement savings, will be forever held by a small, elite group of corporate insiders—who will pass that power down to their heirs.” He has called for exchanges to require, as a condition of listing, that issuers with dual class give their shareholders the opportunity to eliminate the dual class structure at some point in the future. Commissioner Jackson supported his position with empirical evidence compiled by the SEC showing value-decreasing effects of companies with perpetual dual class stock as opposed to companies with dual class that adopted sunset provisions. Commissioner Jackson also cited long-held American beliefs based on Thomas Jefferson’s work against “pseudo-aristocracy” and the idea that “[i]n America, we don’t inherit power, and we don’t hold power forever.”

Sunset provisions appear to be a middle ground argument designed to blunt the impact of dual class stock. However, these arguments have focused on sunsetting in general, and proponents of sunsets have focused primarily on time-based sunsets. We analyze both those positions in further detail.

A. Time-Based Sunset Provisions

The type of sunset that has received the most widespread support is the time-based sunset. A time-based sunset requires that the dual class stock expire at a pre-specified date, typically a date that is established in the charter of the company at the time of the IPO. The

---

100 We question the proposition that an inappropriate governance structure can somehow be made acceptable if it is limited in duration, although we recognize that this principle has been accepted in other contexts. See, e.g., Grutter v. Bollinger, 539 U.S. 306, 341-343 (2003) (observing that, although race-based admissions procedures may violate the Fourteenth Amendment, they may be permissible as long as they are limited in duration).

103 Jackson, supra note 7. The entrenching effect of dual class has been questioned in a number of articles. See Kobi Kastiel, Against All Odds: Hedge Fund Activism in Controlled Companies, 2016 COLUM. BUS. L. REV. 60, 159-60 (2016)

105 See, e.g., CFA Institute, Dual class shares and the need for safeguards (2018), https://www.cfainstitute.org/-/media/documents/survey/dual-class-shares-survey-report.ashx (reporting that, in a survey of CFA members in the Asia Pacific, 94% supported time-based sunset provisions as an appropriate safeguard for companies with dual class structures); see also Anand, supra note __ (describing the case for fixed-time sunsets).
concept behind a time-based sunset is that it provides a period of time for the founder to realize his idiosyncratic vision. When the pre-set date arrives, share capital of the company converts to a single class.

1. The Rationale for Time-based Sunsets

Time-based sunsets are based on the proposition that, although a dual class structure may initially enhance firm value, the utility of the structure declines over time following the IPO. Several academic studies provide evidence of this decline. For example, Lucian Bebchuk and Kobi Kastiel show that “as time passes, the potential costs of a dual-class structure tend to increase while the potential benefits tend to erode.”\(^{106}\) Cremers, Lauterbach and Pajuste find similar trends, demonstrating that, although dual class firms are generally valued more highly at the time of the IPO, that valuation premium is eroded in about six to nine years post IPO.\(^{107}\) They further find that, over that time period, the difference between voting power and equity stakes of the controlling shareholders grows significantly.\(^{108}\) Kim and Michaely find that, as dual class companies mature, their operating margins and labor productivity fall more and the pace of innovation declines faster than single class companies.\(^{109}\)

The Council of Institutional Investors, which has long-opposed dual class structures altogether, has taken the position that, to the extent dual class structures are permitted, all dual class companies should contain a mandatory time-based sunset provision. On October 24, 2018, the CII submitted a letter to NASDAQ and a letter to NYSE asking these exchanges to amend their listing standards to require newly-listed companies with dual class structures to include mandatory sunset provisions. According to the CII, such a provision should have the effect of converting the issuer’s high vote stock to one-share, one-vote “no more than seven years after IPO date.”\(^ {110}\) Similarly, the Canadian Coalition for Good Governance has advocated a five year sunset.\(^ {111}\)

Issuers have responded to the demand for time-based sunsetting. According to a study by Andrew Winden, of a sample of 139 companies with dual class stock, only two companies had time-based sunset provisions prior to 2010, but currently 18% have time-based sunsets. For companies which IPO in 2010 or after 32% of dual class companies have a time-based sunset.\(^ {112}\)

2. The Arbitrary Nature of Time-Based Sunsets

One challenge with sunsets is identifying the appropriate length of time before the sunset is triggered. Among existing public companies with time-based sunsets, the time period varies substantially from as short as 3 years to as much as 20 years in the case of the 2012 Workday

\(^{106}\) Bebchuk, et al., supra note 15, at 590.
\(^{107}\) Cremers et al., supra note 78, at 5-6.
\(^{108}\) Id. at 11.
\(^{109}\) Kim et al., supra note 47, at 2.
\(^{112}\) Winden, supra note 16 at 59.
Groupon has a five year sunset, Yelp has a 7 year sunset and Fitbit has a 12 year sunset. According to Winden, the most common period for a sunset based on time is 7 or 10 years. In the CII’s data of 24 companies that have gone public with time-based sunset provisions, there is little consistency in the sunset period --10.5% of sunsets were 5 years; 31.6% 7 years; 36.8% 10 years; and 21.1% longer than 10 years. 

There is nothing inherently problematic about issuer-specific variation in the sunset length. Theoretically, each firm should be picking the time period best suited to its founder. But there is no evidence that this is the case. Rather, the sunset lengths chosen by individual firms do not appear to be tied to characteristics of the firms and their founders. For example, Workday went public in 2012 with a 20-year sunset provision. At the time of its IPO, it founders were 71 and 46, meaning that they will be 91 and 66 at when the sunset is triggered.

More problematic than the variation is the fact that the length of the sunset period appears to be arbitrary and does not seem to correlate with any theory about the length of time necessary for a founder to implement his or her vision. If a founder’s strategic vision is flawed or the founder is otherwise inclined to exploit private benefits, the insulation conferred by even a relatively short sunset may be unwarranted. Commentators have noted, for example, that many dual class issuers struggle financially even in the first few years after their IPO, suggesting that, at least for these companies, a five or seven year sunset is much too long. On the other hand, the benefits from the founder’s innovative vision need not be limited to the initial years following the IPO. For example, the founders of Facebook and Google are still at the helm of their companies and appear to be creating value despite being public for 6 and 14 years, respectively.

For similar reasons, a one-size fits all approach to sunsets – like that proposed by the CII or the adopted by index providers does not make sense. The time frame necessary for realization of company’s goals is likely to vary depending on the company based on factors like the company’s maturity at the IPO stage, the duration of its business model, and the time required to develop its products or services and bring them to market.

It is also uncertain whether any time based sunset at the IPO level can successfully align founder vision with control. People change as do firms. An example of such a change is Sumner Redstone who is 94 and in declining health but controls CBS through his ownership of National

Amusements. It may very well be that a founder’s vision is aligned with the firm’s at the IPO level but that for a variety of reasons, including personal ones, this diverges at some point. Predicting the point of this divergence purely by passage of time seems an impossible task.

Currently the market has limited experience with the effect on an issuer when a sunset provision is triggered. The Council of Institutional Investors records only three companies in which the dual class structure was terminated due to the effectiveness of a time-based sunset provision: Groupon, Texas Roadhouse and Maxlinear. All three sunsets were triggered fairly recently. We therefore have little experience with how these provisions will function in reality. Another way to frame this issue is that, we lack sufficient information to determine if the sunsets eliminate valuable protection for a founder to implement his or her vision. Moreover, although some analysts have observed that the elimination of the dual class structure may facilitate an issuer’s acquisition, a result that could potentially increase firm value, buyouts of companies in this limited sample have failed to materialize.

3. The Moral Hazard Problem

Not only is it unclear that a time-based sunset can accurately predict what duration of dual class is likely to maximize firm value, but it also creates a problematic incentive structure. Time-based sunsets identify a specific date at which a founder will lose control. This date, which Jack Coffee describes as a “sharp cliff,” increases the incentive for founders to use control, while they have it, to maximize their personal economic position even if their actions sacrifice value for the minority shareholders. These incentives increase as the expiration date for the dual class structure draws closer. For example, the knowledge that the founder’s control is drawing to an end can cause the founder to engage in short-termist behavior such as excessive risk-taking or conservatism, self-dealing or opportunistic behavior with other ventures. Founders may seek to divert valuable opportunities to other firms or to reduce the degree to which they invest energy and innovative ideas in an issuer at which they will soon lose control. A particular risk is that founders will enter into transactions that enable them to sell their control block at a premium or that provide them with other private benefits.

Yelp’s dual class structure also converted in 2016 due to a decline in the percentage of stock held by the founders). 123 Id. 124 See, e.g., Bryan Finnigan, End Of Yelp’s Dual-Class Share Structure Could Provide Catalyst For Takeout, BENZINGA, Sept. 26, 2016, https://www.benzinga.com/analyst-ratings/analyst-color/16/09/8495111/end-of-yelps-dual-class-share-structure-could-provide-ca (observing that Yelp’s elimination of dual class makes it a more attractive acquisition target); Will Healy, Yelp Inc Is a Buyout Target Masquerading as a Growth Company, Investorplace, Feb. 8, 2018, https://investorplace.com/2018/02/yelp-inc-yelp-stock-buyout-target-growth/ 125 Coffee, supra note ___ (NYLJ) (observing that, over a year after Yelp’s conversion to a single class structure, “a buyout remains far from certain”). 126 Although corporate law allows a controlling stockholder to retain a control premium upon the sale of the control block, it is unclear what legal standard courts would apply in evaluating such a transaction. Other options including an acquisition in which the founder obtains a management position in the acquiring company. For example, MuleSoft founder Greg Schott retained control of MuleSoft, which was to be operated as a separate division, upon
Conversely, the controller may attempt to prolong the time of the dual class stock. Companies without sunset provisions have already engaged in similar transactions. For example, Google and Zillow have issued Class C non-voting shares that allow the controller to further dilute its interests without giving up control. Facebook also attempted this maneuver but withdrew the proposal in light of litigation.

4. Shareholder Retention Voting

Supporters of mandatory sunset provisions have attempted to respond to the argument that the automatic trigger of a time-based sunset provision may not align with the time period appropriate for the founder to engage in value-creating behavior by coupling a time-based sunset with an optional shareholder retention vote. Such a vote would enable existing shareholders, voting on a one-share/one-vote basis, to retain or extend the dual class structure, prior to its expiration. For example, the CII proposal would allow shareholders of dual class issuers to vote on a one-share/one-vote basis to extend the dual class structure. Similarly, the Canadian Coalition for Good Governance recommends a five-year sunset for dual class structures unless a majority of the minority shareholders vote to renew it.

The retention vote would have the effect of providing minority shareholders with an option. If, in their view, the founder’s control is continuing to enhance firm value, the minority shareholders can vote to retain it. If, however, the insulation has outlived its usefulness or generating excessive agency costs, the shareholders can vote against retention, at which point the shares will convert automatically to a single class structure.

Commentators have devoted little attention to analyzing the operation of such a shareholder vote, however. Any expectation that a vote of existing minority shareholders will function efficiently to identify situations in which there is value to retaining a dual class structure is highly problematic. First, existing minority shareholders will invariably benefit from eliminating dual class, as the effect of the sunset will be to transfer control from the founders to the public shareholders. As the courts have recognized in other contexts, the value of this control is substantial. Accordingly, public shareholders will be conflicted in evaluating the voting decision as they will have to weigh the value of obtaining control against the potential value of extending the dual class structure.

129 See CII letter to NYSE, *supra* note __, at 1 (calling for mandatory sunset provisions “subject to extension by additional terms of no more than seven years each, by vote of a majority of outstanding shares of each share class, voting separately, on a one-share, one-vote basis”).

130 Anand, *supra* note 44.

Second, the need of dual class is based on the proposition that market forces are not sufficient to enable public shareholders to evaluate the founder’s vision and the firm’s long-term business plan adequately and will, as a result, imprudently sacrifice long term firm value. As a result, defenders of dual class argue that it is necessary to insulate the founder from short-termist market pressure. To the extent that market forces are not sufficient to enable public shareholders to evaluate and price sunset provisions accurately at the IPO stage, it is unclear why their ability to do so midstream will be superior. As a result, the theory that public shareholders can properly evaluate whether to retain dual class at the time of the retention vote seems inconsistent with the basic premise of the dual class structure.

One possible response that, at the time of the retention vote, shareholders have better information with which to evaluate the value of dual class. When voting on whether to retain the dual class structure, public shareholders have the benefit of knowing how the firm has performed subsequent to the IPO, and they have the enhanced transparency into that performance afforded by the public reporting process. Although this observation is fair, it does not distinguish the retention vote, in a meaningful way, from the IPO stage or the role of market discipline during the initial pre-sunset period. The rationale for dual class, in either case is that shareholders are limited in their ability to evaluate and appreciate the founder’s long-term vision going forward and that, on net, insulation from market discipline will promote innovation and increase firm value. Many recent dual class IPOs involve issuers of substantial size and that have relied on the private capital markets to operate for a number of years. If dual class structures are appropriate, it is because investors cannot reliably evaluate and protect the future innovative behavior at those issuers. Similar information asymmetries are likely to limit public shareholders’ ability to evaluate an issuer’s potential for further innovation in the context of a sunset retention vote.

Similarly, although the shareholder retention vote can also be understood as providing a form of insurance against a founder implementing the dual class stock in a value destructive manner, we reject that justification as a basis for requiring a time-based sunset. The insurance argument highlights the substantial potential costs in terms of a misapplication of the sunset period and the potential for founder misconduct prior thereto. While quantifying these costs is impossible, we believe that they could easily outweigh the benefits of this insurance. In short, the insurance claim proves too much – if insurance is truly warranted, it is because of the potential costs of the dual class structure.

B. Alternative Sunset Provisions

As we explain in the preceding section, the mere passage of time is a poor proxy for evaluating whether the utility of a dual class structure has evaporated. To the extent that sunsets are an appropriate response to a decline in the value of dual class structures, they should focus more precisely on objective events that are more likely to result in the founder losing track of his or her mission or being overly incentivized to favor his or her own interests. We term such provisions event-based sunsets.

In this section, we identify several events in this category such as dilution of the founder’s interest, the founder’s death or departure from the issuer, and the transfer of voting rights to third parties such as heirs. Issuers have adopted event-based sunsets in varying degrees, but they have received far less investor attention than time-based sunsets. We conclude that, although the market has not focused carefully on structuring time-based sunsets
appropriately, they offer a more promising approach. As of yet, however, the costs and benefits of event-based sunsets are untested, and it is equally unclear whether they can be designed in a way to overcome the limitations of time-based sunsets that we discuss above. As a result, while we do not advocate the imposition of mandatory event-based sunsets, we encourage investors and commentators to develop event-based sunset provisions through private ordering.

1. Dilution of the Founder’s Interest

Lucian Bebchuk and Kobi Kastiel have documented that part of the problem with dual class is an increasing gap between the founder’s voting power and his or her economic interest: they term this gap the “wedge.” They find that an increase in the size of the wedge is correlated with a decrease in firm value, and they reason that as the economic stake of the founder is reduced while voting control remains the same, the founder is incentivized to reap private benefits from the firm. This incentive problem can manifest it in direct ways through wealth transfers from the firm to the individual or favored interests, or through the founder’s decision founder to push the firm in directions that satisfy his or her non-economic idiosyncratic visions. An increased wedge can also reduce the founder’s engagement in operations.

These and other incentive problems theoretically justify sunsets keyed to dilution. Such sunsets are relatively common. According to Winden there are 48 companies in his sample with dilution-based sunsets. The level of dilution required to trigger the sunset ranges from 5% to 25% with 54% of companies having a 10% dilution trigger. Again, this threshold seems arbitrary, and we see evidence of issuers gravitating to a one-size-fits-all approach. In contrast to time-based sunsets, however, the rationale of the dilution sunset is to ensure that the founder retains a meaningful economic interest in the issuer, and there is a plausible argument that once the founder’s interest drops below 10%, his or her economic interest is no longer sufficiently aligned with the interests of the issuer. Moreover, to the extent that the founder wants to avoid triggering the sunset, the solution is to retain a sufficient stake in the firm which will benefit all shareholders by reducing the size of the wedge and maintaining the alignment of interest between founder and firm.

As of the time this article was written, the dual class structure of at least one issuer, Yelp, has been terminated due to the triggering of a dilution-based sunset. Yelp went public in 2012 with a dual class structure containing a provision that it would be automatically converted into a single share structure once the founders’ economic stake dropped below 10%. This occurred on September 23, 2016 and in the wake of this declassification Yelp stock rose 2.6%. We note that the conversion would have occurred much later if Yelp had adopted a standard time-based sunset.

We do not claim that dilution-based sunsets are address all the limitations of time-based sunsets, and further refinement of their operation is likely necessary to make them sufficiently responsive to the concern described above. In particular, because of the founder’s higher voting rights, the threshold for triggering the sunset under dilution-based sunsets, as currently

133 Bebchuk & Kastiel, supra note 15, at 603.
134 Winden, supra note 16, at 59.
135 Id. at 15.
137 Id. On that day the S&P 500 rose []%.
structured, may be too low. At the time of its IPO, Zynga’s dual class stock, for example, gave its founder Mark Pincus 70 votes per share, meaning that Pincus could retain control with an economic interest of less than 3% of the company. Universal Health Services’ Class C common stock gives founder Alan Miller 100 votes per share.\(^{138}\) Concededly, it is likely impossible to measure the right level of dilution or the effect of this divergence of interest in dual class stocks. Theoretically, however, dilution-based sunsets offer a responsive better tailored to the concern that, as the founder’s economic interest is reduced, his or her incentives become misaligned sufficiently to create a risk of rent-seeking or other value destroying actions. We further note that dilution-based sunsets do not create the same perverse incentives as time-based sunsets because the founder can avoid the trigger by retaining a sufficiently large economic stake.

2. Transfer of founder’s interest.

Dual class stock sometimes allows the holders of high vote shares to transfer the higher voting rights together with a transfer of the shares by sale, gift or inheritance. The most infamous example is Facebook which permits Mr. Zuckerberg to transfer his high vote stock to his heirs. Similarly, Snap allows for transfers to heirs.\(^{139}\) Provisions that permit founders to transfer high vote stock to their heirs would appear to conflict directly with the justification for dual class of protecting the founder’s ability to achieve his or her idiosyncratic vision. Although an argument could be made that the founder’s successors will continue to provide the founder’s vision, there is little reason to expect that the founder’s heirs have any advantage in doing so. Indeed asset destruction through intergenerational transfer is a well-documented effect. Allowing a founder to retain high voting rights even upon the transfer of the stock instead enables the founder’s heirs to convert a control right that is designed to maximize firm value into a private benefit.

As a result, sunset provisions that convert high vote stock to one-share/one-vote when the founder bequeaths or gifts that stock seem common sense. The observation that the founder may transfer high vote stock to third parties who do not warrant the insulation of the dual class structure is not limited to situations such as inheritance, however. Investors might have similar concerns when the holder of high vote stock sells in a market transaction. Notably, dual class stock differs from tenure voting in that many dual class structures do not automatically convert the high vote stock when it is sold or transferred, even though the transfer presumably removes control from the founder whose vision the structure was designed to protect and vests that power in someone else.

Transfers of high vote stock have broader potential to erode value from the firm and the public shareholders. For example, as noted above, currently Delaware law allows controlling shareholders to sell their interest for a premium.\(^{140}\) The ability of a controlling shareholder to do so could, in the case of dual class, lead to a wealth transfer from the public shareholders to the controller. Such a wealth-transfer is particularly problematic in situations in the sale is designed

\(^{140}\) Abraham v. Emerson Radio Corp., 901 A.2d 751, 753 (Del. Ch. 2006) (“Under Delaware law, a controller remains free to sell its stock for a premium not shared with the other stockholders except in very narrow circumstances.”).
to avoid the effects of a mandatory conversion. A number of dual class issuers have responded to this problem by including equal treatment provisions in their charters. These provisions prevent high vote shareholders for selling their stock at a premium over the price that is available to low vote shareholders. In Delphi, which had a charter providing that both its high and low voting stock would receive the same consideration in any merger, founder Robert Rosenkranz attempted to use his high vote shares to amend the charter and remove that provision. The court concluded that Rosenkrantz’s effort to do so was coercive.

3. Death, Incapacitation or Departure of Founder

The death, incapacitation or departure of the founder raises similar issues as transfers. The effect may be compounded however by the fact that when a founder dies or is incapacitated but retains voting control, the company can be left without leadership or direction.

A paradigmatic example is that of Sumner Redstone and the two companies he controls CBS and Viacom. Sumner Redstone is now 94 and reportedly is unable to speak coherently or move about. His incapacitation has led to litigious corporate governance battles at both Viacom and CBS between Mr. Redstone’s daughter Shari Redstone and the boards at each company. In each case the companies attempted to defy Ms. Redstone’s attempts to assert Mr. Redstone’s voting power; costly battles which both ended in the departure of both firms CEOs and a restructuring of each company’s board.

Sunsets to prevent this situation can take several forms. A sunset can be triggered by the founder’s death or incapacitation. For example, a sunset that converts high vote shares to single vote shares can be triggered when the founder is no longer chief executive officer of the company or no longer involved in the day to day operations. Again, if dual class is designed to insulate the founder’s idiosyncratic vision, that insulation is no longer warranted when the founder is not making operational decisions.

Of course, issuers can voluntarily eliminate their dual class structure upon the occurrence of this type of event. For example, Zynga, which was heavily criticized for its 70-1 dual class structure, converted to a single class structure after founder Mark Pincus left as CEO and it was announced he was transitioning to non-executive chairman from chairman of the board. Zynga’s shares rose 1.4% in trading upon this announcement. Pincus’s conversion decision was voluntary, however. A departure-based sunset would provide predictability. In addition, a

146 Andrew Winden takes the reasonable position that “death and incapacity sunsets should be included in all dual-class charters.” Winden, supra note 16.
departure-based sunset is particularly useful if the founder’s departure is due to medical reasons or an intra-corporate dispute.

One might expect sunsets of this type to be commonplace given the foreseeable nature of these events, but they are not. Andrew Winden documents that only 48 dual class companies have this type of provision while 91 do not. We do not know why these provisions are not more common but expect that it is a function of the inefficiencies of the IPO market. Given the relatively recent growth in the number of issuers that IPO with dual class structures, the death or incapacitation of a founder may have limited salience to investors. More specifically, the inclusion of these provisions may depend upon the law firm utilized at the IPO stage by the firm as well as the idiosyncrasies of the founder.

4. Other Sunsets

The foregoing discussion identifies several types of event-based sunset provisions that, we believe, are more closely tied to developments that undercut the original justification for a dual class structure than time-based sunsets. The list that we offer is illustrative, not exhaustive; other situations may raise similar concerns and warrant treatment through a sunset provision. For example, one could imagine creating a dual class structure with a sunset that is triggered by a founder’s misconduct such as a breach of fiduciary duty, although we are not aware of any issuers that have adopted such a provision.151

IV. Moving Forward

Our analysis of sunsets and dual class stock has a number of implications. First, and perhaps most important, the debate over sunsets should be separated from the debate over the efficacy and desirability of dual class voting structures. Commentators appear to be supporting sunsets as a compromise on the merits of dual class, but the value of dual class stock should be debated on its own merits. The inclusion or omission of a sunset provision does not resolve the question of whether dual class structures are problematic. Instead, policy responses to dual class stock should focus on the economic value and social welfare effects of dual class.

We concede that, at least in the short term, empirical studies are unlikely to resolve the debate over dual class definitively. That feature does not distinguish dual class from many other corporate governance provisions such as staggered boards and poison pills. It may be the case that the value of governance provisions is firm-specific and that a particular provision is value-enhancing for some firms and value-decreasing for others.153 Alternatively, further experience

150 Winden, supra note 16, at 61.
151 Winden reports that, in his sample, no issuers have a sunset for breach of fiduciary duties. Winden, supra note 16, at page 39 (“I am not aware of any companies that have instituted such sunset provisions to date”).
152 See, e.g., Lucian Bebchuk & Alma Cohen, 2005, The costs of entrenched boards, 78 J. Fin. Econ. 409 (2005) (reporting that firms with staggered boards have a lower value); K.J. Martijn Cremers, Lubomir P. Litov, & Simone M. Sepe, Staggered boards and long-term firm value, revisited, 126 J. Fin. Econ. 422 (2017) (concluding that staggered boards can, in appropriate circumstances, increase long-term firm value).
with dual class structures may clarify the extent to which they add value by solidifying control
with a visionary and value-creating entrepreneur, \textsuperscript{154} or whether they counterproductively
entrench that control in circumstances in which the vision of the entrepreneur declines or is
lost. \textsuperscript{155}

In this scenario, sunsets should not be understood as a regulatorily-imposed fix to
minimize the duration of a problematic governance structure but as a feature that offers the
potential to align the use of dual class stock with value creation. In this regard, we believe that
there should be more thorough and rigorous thinking both about the use of sunsets and about the
form that such sunsets should take.

In particular, we argue that the growing effort to force dual class issuers to adopt time-
based sunsets is inappropriate. Time-based sunsets should not be a necessary precondition for
the use of dual class stock, and calls for the imposition of such a requirement through regulation,
exchange listing requirements or restrictions on index inclusion are misguided. Although time-
based sunsets appear to reflect a compromise position, as we show, they are poorly tailored to
addressing the potential limitations of the dual class structure. At the same time, time-based
sunsets may lead to complacency about dual class structures and encourage investors and the
markets to accept dual class at issuers where its potential value is questionable.

To date, however, our analysis suggests that investors and the market do not know
enough about either dual class or sunsets to use regulation, index requirements or stock exchange
rules to force companies into time-based sunsets. Instead, we should allow private ordering but
encourage greater attention to the specific developments that are likely to erode the potential
value of dual class such a dilution, transfer and departure. There is particular value to market
participants working to develop norms and standards around the types of sunsets that the market
should demand of dual class issuers. We call for lawyers to be more capacious in drafting sunset
provisions and for institutional investors to pay greater attention to the specific features of sunset
provisions as well as the manner in which they operate in the context of a specific firm. Finally,
to the extent that issuers adopt retention votes as a component of their dual class structures,
proxy advisory firm such as Institutional Shareholder Services need to develop principles by
which to evaluate whether retention or termination of a dual class structure is warranted.

Our final point is that, to an extent, the debate over dual class and sunsets has a tendency
to overlook broader questions about the role and purpose of voting rights in publicly traded
companies. By increasing the relative voting power of the founder, dual class structures operate
to limit the voting power of public shareholders. As such, they raise questions about the
importance of voting rights, the issues on which shareholders can and should exercise voting
authority, and the viability of alternatives to voting -- such as exit, litigation and engagement --
for limiting the power of controlling shareholders. \textsuperscript{156}

Examination of these issues is critical as the composition of the investor base continues to
evolve. Large institutional investors, many of which rely primarily on index-based investment

collaboration has largely supplanted competition between shareholders and managers for control).
strategies, own an increasing percentage of publicly-traded securities. Commentators debate
the incentives of these investors, the extent to which they engage in informed voting
decisions, and the degree to which their investment objectives are subject to short-termism.
The policies and procedures by which these investors exercise their voting power may vary
depending on the subject matter of the vote.

In a stylized world, the effect of dual class on issuer control can be modeled in terms of
voting outcomes. In the real world, the impact of dual class is less clear. By way of example,
after a series of scandals involving Uber, commentators warned that shareholders lacked the
power to restrain or remove then-CEO Travis Kalanick because of the voting power he held by
virtue of Uber’s dual class structure. Nonetheless, in the face of pressure from Uber’s major
investors, Kalanick resigned, and Uber’s board subsequently removed the dual class structure.
Uber’s dual class structure did not, in the end, prevent the company from responding to a founder
who was limiting corporate value.

Conclusion

The increasing adoption of dual class structures has generated concern. In response,
some commentators have called for the adoption of sunset provisions to limit the duration of the
dual class structure. We argue here that compulsory sunsets, and time-based sunsets in
particular, are an inappropriate response to the potential problems of dual class stock. Although
we observe that sunsets that are tied to particular events likely to reduce the value of dual class,
such as dilution, transfer or departure of the founder, may prove valuable, we note that
experience with such sunsets is limited to date. Consequently, although we encourage issuers
and investors to experiment with the development and use of event-based sunsets, we suggest
that, at present, that experimentation take place through private ordering.
