COMPARATIVE STUDY, Aeyal Gross & Colleen Flood, eds., Cambridge University Press)

Allison K. Hoffman

INTRODUCTION

When asked to write a chapter on how litigation has advanced a right to health in the
U.S., I responded skeptically, both because evidence of the existence of any such right is weak
and the role of litigation in promoting its development is small at best. A snapshot of the U.S.
health care system evinces the absence of even a more narrow right to health care – a guarantee
of equitable access to basic medical care. Instead, it reveals a fragmented picture of public and
private financing that leaves many people lacking meaningful access to care. More so, the
places where hints of a right to health care appear in the U.S. are largely not the result of
litigation, but rather a product of incremental legislative efforts to advance health care access,
suggesting the more compelling picture might be one of legislation.

Litigation to advance a right to health care has faced paralyzing constraints. Unlike in
many other countries, where litigation increasingly plays a central role, there is no overarching
constitutional or statutory right to health in the U.S., to serve as a foundation for legal challenges.
As further impediment, the Supreme Court has limited access to the courts and remedies for
individual claims arising from statute or contract. Such structural barriers – legal, procedural,
and political – have constrained the use of litigation to define or defend an American right to
health care.

In light of these roadblocks, I consider whether legislative change may offer a better
(albeit also problematic) pathway to expanding health care equity in the U.S. Over the past 50
years, incremental, majoritarian (sometimes barely) legislative efforts have created what can be
described as pockets of a right to health care for some populations, such as the elderly or
“deserving poor.” Now, I suggest, the 2010 health reform law, the Patient Protection and
Affordable Care Act (PPACA), offers a vision for an emerging, broader American right to health

1 Assistant Professor of Law, UCLA School of Law. My gratitude to Devon Carbado, Scott Cummings, Daniel
Dumont, Russell Korobkin, Sam Krasnow, Amy Monahan, Abigail Moncrieff, Steve Munzer, and Kathy Stone for
comments on various drafts of this chapter and to Billy Herbert for excellent research assistance.

2 The more expansive notion of a right to health implies state obligations to promote population health, through
protections and entitlements, by addressing “preconditions” of health outcomes, such access to food, clean water,
and sanitation, as well as medical care. Siri Gloppen & Mindy Jane Roseman, Introduction: Can Litigation Bring
Justice to Health in LITIGATING HEALTH RIGHTS: CAN COURTS BRING MORE JUSTICE TO HEALTH 1, 3-4 (Alycia Ely
Yamin & Siri Gloppen, eds., 2011). Some suggest an even more expansive notion that requires attention also to
social determinants of health, including education and housing. For research on these “social determinants,” see,
e.g., RICHARD WILKINSON & KATE PICKETT, THE SPIRIT LEVEL (2009) (examining the effect of income inequality
on health); Michael G. Marmot, Social Differentials in Health Within and Between Populations, DAEDALUS, Fall
1994, at 197; Geoffrey Rose, Sick Individuals and Sick Populations, 14 INT’L J. EPIDEMIOLOGY 32, 38 (1985);
Peter Townsend & Nick Davidson, Introduction to INEQUALITIES IN HEALTH: THE BLACK REPORT 13, 20-23
(Douglas Black et al. eds., 1982).

3 For a description of fragmentation and its consequences, see Allison K. Hoffman, Oil and Water: Mixing

4 Gloppen & Roseman, supra note 2, at 1-2 (describing the recent rise in health rights litigation globally).
care, realized by blending the role of public insurance and private insurance and relying on both to achieve more universal, affordable access to health care. The Supreme Court, while previously not influential in advancing an American right to health care, has now played a central role, by affirming PPACA’s legal validity.\(^5\)

Reflecting on the historical development of the U.S. health care financing system, the limited success of health care rights litigation, and the success of past legislative efforts, this chapter reveals two primary insights. First, it illustrates how and why the U.S. lies in vivid contrast to many other countries in this volume, where battles over health rights – defined narrowly or broadly – occur largely in the courts. Americans have been and will likely continue to be relatively more reliant on statutory advancement of health care rights. Second, it argues that, going forward, PPACA offers transformative potential for an American right to health care, by gradually redefining who does (and perhaps by implication should) have access to health care, regardless of ability to pay. Whether this formal legal change will shape social consciousness is still unclear.\(^6\) Early backlash to both the law and the Supreme Court decision raises doubts. Yet, past experience with incremental health reform in the U.S. offers some evidence that PPACA could provide the vision and foundation for an evolving American conception of a right to health care. If PPACA offers the best pathway to social change, supporters of a right to health care should be particularly invested in its success, even if they see its vision as flawed or incomplete.

As a preliminary matter, in this chapter, I focus on a right to health care. More precisely, I examine a right to health insurance, which usually – but not always – enables access to medical care.\(^7\) This focus is admittedly and intentionally narrow. While there is rich debate among scholars\(^8\) and international human rights bodies\(^9\) on the advisability and meaning of a right to health, I do not intend to join this broader debate. Rather, I examine equitable access to health care, which most agree is a critical component of a right to health\(^10\) and which lies at the heart of current controversies in law, policy, and politics in the U.S. This right to health care demands equality of opportunity to access medical care but not necessarily equality of health

---

\(^6\) Legislation alters health care financing in ways consistent with a right to health care, by increasing affordable access to meaningful health care. Whether social consciousness will follow is more complex and controversial. I suggest several reasons why legislative change might offer the potential to shape social consciousness of a right to health care, without asserting that it will, a question beyond the scope of this chapter. Catherine Albiston describes the academic debate on how law shapes social consciousness in INSTITUTIONAL INEQUALITY AND THE MOBILIZATION OF THE FAMILY AND MEDICAL LEAVE ACT 11-17 (2010).

\(^10\) DANIELS, supra note 8 at 29-30.
outcomes, which requires well more than access to medical care. I also do not intend to define what particular medical care is core to a right to health care, but I do illuminate how the design and regulation of health insurance implicitly asserts such definition.

While circumspect about the future of PPACA and its ability to provoke broader social mobilization, my goal in this chapter is to show how it offers a transformative vision, and perhaps the most promising pathway in light of impediments to litigation, for an emerging right to health care in the U.S.

PART 1: BEFORE PPACA: INSURANCE FRAGMENTATION AND INEQUITABLE ACCESS TO HEALTH CARE

To understand attempts to improve health care equity in the U.S., it is necessary to examine the roots of inequity in the current system, which has become fragmented into many, incommensurate sources of financing. This fragmentation occurred in two ways. First, market and historical processes together created proliferation of sources and types of insurance, which I call “structural fragmentation.” Second, the legal standards among these types have diverged over time, which I call “regulatory fragmentation.” The result is that some types of insurance are superior to others. Because not everyone can access all – or any – of these types, fragmentation has resulted in inequitable access to medical care among Americans, depending on how – or whether – an individual is insured.

A. Structural Fragmentation

The U.S. health care financing system is a maze of public and private insurance programs, each covering different services and items for different populations. The primary fissure is between public and private insurance. The major public health insurance programs, Medicare and Medicaid, were created in 1965, intending to cover only a limited subset of Americans. Subsequently, private insurance developed to fill in the picture and, in so doing, diffused political pressure to expand public insurance, while still not meeting the needs of many not eligible for public insurance.

Public insurance programs create what could be considered a weak statutory right to health care for about 90 million Americans, mostly in medically vulnerable populations, by defining entitlements to membership in programs for financing medical care. These rights are weak, however, for several reasons. First, because they are statutory, these programs can be terminated or altered at any time by legislators and regulators. With regard to Medicaid, in particular, the Department of Health and Human Services can waive program requirements for state demonstration projects. Second, while these programs guarantee qualifying individuals access to covered medical services, they do not necessarily guarantee access to covered medical services.

1 See Jennifer Prah Ruger, Ethics of the Social Determinants of Health, 364 LANCET 1092, 1092-96 (2004) at 1092-94 (contrasting an equality-of-opportunity approach, as advocated by John Rawls and Norm Daniels, and an equality-of-results approach, closer to Amartya Sen’s vision).
13 For in-depth examination of fragmentation, see Hoffman, supra note 3.
services if providers are not available and willing to participate in the programs.\textsuperscript{16} Third, the public programs have limited enforcement mechanisms, making some statutory rights not individually enforceable, as discussed below.

Several public insurance programs, together, constitute this week right to health care for some Americans. Most significantly, in 1965 the U.S. Congress passed legislation to establish Medicare,\textsuperscript{17} a federal program to finance care for the elderly (generally those over 65 years old) and Medicaid,\textsuperscript{18} a joint federal and state health care program for the poor and disabled. Other public programs include the State Children’s Health Insurance Program (CHIP) for near-poor children, Indian Health Services (IHS) for American Indians and Alaskan Natives, and TRICARE and the Veteran Administration’s (VA) program for active duty military personnel, veterans, and their families. These programs share characteristics found in social insurance programs in other countries, such as tax-based financing, broad risk spreading, and access to a range of benefits with limited cost sharing.\textsuperscript{19} They are all publicly financed and pay for privately-delivered health care, except for the VA and IHS, where the delivery system is public as well. We could think of these programs as delineating who – including, for example, the elderly and deserving poor– deserve guarantees to medical care, even if unable to pay for it on their own.

In contrast, the U.S. private health insurance market, the source of coverage for 195 million Americans,\textsuperscript{20} is not available to all, and lower income or less healthy individuals are less likely to have access to private insurance.\textsuperscript{21} The private market is itself split into three markets based on employee group size – referred to as “large group,” “small group,” and “individual” markets. The quality of coverage generally decreases and cost increases in this same order.

Most privately-insured Americans obtain large or small group employer coverage, where the employer has discretion over the design of this coverage.\textsuperscript{22} This system of “employer-sponsored insurance” (ESI) became common in the mid-20\textsuperscript{th} Century as a work-related benefit and has become deeply entrenched since. While employers are not required to offer employees health insurance, many do because expenditures on health benefits are excludable from taxes for both the employer and employee. The beneficial tax treatment means that health benefits have become a less expensive way to compensate employees; health insurance costs employers approximately $.65 per dollar of benefits.\textsuperscript{23} In addition, some employees, especially if salaried and higher-income, expect health benefits.\textsuperscript{24}

Not all private insurance is obtained through employers. Some workers lack access to ESI, either because they work for an employer who does not offer it – more frequently the case with smaller employers – or because they do not qualify for employee benefits due to contingent

work status, including part-time and seasonal employment. Without access to ESI, individuals seek out coverage on the “individual market,” purchasing a policy directly from a private insurer. Six to seven percent of the non-elderly (about 15 million individuals) have individual market coverage.\(^{25}\) This market is more unstable and expensive, dollar-per-dollar, than group coverage, as explained below.

The remaining 16-17% of the total non-elderly population (about 50 million individuals) is uninsured and has limited access to medical care;\(^{26}\) unless they can pay for it directly, they may only receive care in limited locations and circumstances, and, at times, at exorbitant costs. For example, the Emergency Medical Treatment & Active Labor Act (EMTALA) guarantees access to emergency services regardless of ability to pay.\(^{27}\) However, if an uninsured person receives care in an emergency room and does not pay for it, the care is considered “uncompensated” at the point of service,\(^{28}\) and the hospital may try to collect payment directly from the patient, resulting in bankruptcies for uninsured and underinsured Americans.\(^{29}\) EMTALA could be understood as creating a limited right for all to access some care but with potentially very high costs.

In sum, U.S. health care financing has evolved into a system with many parts. In the public system, the least well off – the elderly and poor – benefit from a circumscribed statutorily-created right to care. In the private system, those with ESI, who tend to be higher-income earners, have more comprehensive insurance coverage, but that coverage exists at the employer’s whim. Many fall through the cracks between these two systems, left to rely on safety nets, such as EMTALA for limited access to care.

B. Regulatory Fragmentation

Structural fragmentation set the foundation for regulatory fragmentation – namely, regulatory inconsistency among the different insurance markets that exacerbated inequities in access to care, depending on the type of insurance coverage an individual has.

1. Regulation of Public Benefits and Eligibility

Public insurance covers a set of basic benefits for eligible populations that gives meaning to the entitlements created in these programs. For the two largest public insurance programs, Medicare and Medicaid, the federal government defines a floor of coverage. Above these baselines, benefits can vary based on what plan a beneficiary chooses or, for Medicaid, in which state she lives.

Medicare covers basic medical services for most Americans over age 65, including inpatient care, outpatient care, and, as of 2006, prescription drugs,\(^{30}\) but generally does not cover routine dental or vision care or custodial long-term care. Most Medicare beneficiaries, unless low income, face moderate out-of-pocket expenses for premiums, deductibles, coinsurance for hospital services, and copayments for outpatient services and prescription

drugs. As a share of income, the median Medicare beneficiary’s out-of-pocket spending increased from 12% in 1997 to over 16% in 2006, even though 90% also hold private supplemental coverage to fill in gaps.\footnote{Kaiser Family Found., Medicare Chartbook Fourth Edition 60 (2010).}

Medicaid programs likewise build on a required core of mandatory eligibility categories and benefits, albeit a thin core. Medicaid is funded by both by the federal (i.e., national) and state governments. The federal government dictates which beneficiaries and benefits states must cover to receive federal matching dollars, beyond which the states have discretion. Prior to PPACA, Medicaid eligibility has been “categorical,” meaning that federal rules require coverage of certain populations, including children under age six and pregnant women in households with incomes below 133% of the Federal Poverty Line (FPL), children age six to eighteen in households with income below 100% of the FPL, and certain categories of people with disabilities.\footnote{Kaiser Comm’n on Medicaid & The Uninsured, Medicaid: An Overview of Spending on “Mandatory” vs. “Optional” Populations and Services (2005).} For reference, the 2011 FPL was USD $22,350 for a family of four and USD $10,890 for an individual.\footnote{HHS Poverty Guidelines, 76 Fed. Reg. 3637-3638 (January 20, 2011).} Beyond these categories, states have had discretion to define eligibility, typically doing so sparingly. For example, in 2009, the eligibility threshold for the non-mandatory category of “working parents” ranged from below 17% of the FPL in Arkansas to below 215% of the FPL in Minnesota.\footnote{KFF Medicaid Primer, supra note 30, at 12.} Many states do not cover childless adults at all.\footnote{Id.}

For most beneficiaries, states must cover certain mandatory services, such as hospital and outpatient services, laboratory and x-ray services, family planning services, and comprehensive diagnostic and treatment services for children.\footnote{Id. at 14. Some states offer an alternative “benchmark” plan for certain high-need beneficiaries. Id. at 17.} In addition, state Medicaid programs may and typically do offer “optional” services, including prescription drugs (which all states offer), dental services, and hospice services.\footnote{Id. at 15.} Eligibility thresholds and benefits thus define the reach and substance of the Medicaid entitlement, but it varies considerably among states. In other words, the meaning of the right to health care guaranteed by Medicaid is not static among enrollees.

2. Regulation of Private Benefits and Eligibility

Private insurance benefits and cost-sharing requirements have been less tightly prescribed, suggesting a less clear and consistent normative vision for private insurance. Regulation of private insurance is reserved to the states unless the federal Congress acts and expressly preempts state regulation, which it has done several times to meaningful effect.\footnote{15 U.S.C. § 1011 (2006).} For example, many employer plans are not subject to state regulation, because of the preemption language in the Employee Retirement Income Security Act of 1974 (ERISA),\footnote{29 U.S.C. § 1144 (2006).} a federal law enacted to enable large, multi-state companies to administer employee benefits (mostly pensions) seamlessly across states. As interpreted by the courts, ERISA preempts most state regulation of employer plans, including all state regulation of “self-insured” employee benefit.
health plans, where an employer retains risk of high expenditures, rather than buying a group insurance product from an insurer to transfer the risk of unexpected high expenditures to that insurer. According to a recent estimate, 60% of all workers and 96% of workers in large companies are beneficiaries of self-insured plans and thus exempt from state insurance regulation.

Employer plans, however, must comply with ERISA and other federal laws that aim to reduce discrimination and spread risk more evenly among employees, who together form the group risk pool. For example, the Health Insurance Portability and Accountability Act (HIPAA), a 1996 statute that amends ERISA, prohibits discrimination against individual members of a group based on an individual’s health status or history. Furthermore, federal tax law also prohibits employers from discriminating in favor of more highly compensated employees and other federal laws prohibit employers from discriminating against employees due to genetic information or disabilities. These laws effectively assert that access to health care should not differ on the basis of these characteristics, even in private markets. The prohibitions on discrimination, however, have limits in application because, apart from a few categories of mandatory benefits, employers can exclude whole categories of care if exclusions are based on actuarial principles and are not a “subterfuge for discrimination.”

The limited, mandatory benefits for employer plans include a minimum hospital stay after childbirth and parity between mental health and substance use disorder benefits, on the one hand, and medical benefits, on the other, to the extent a health plan covers both. Although many employers do choose to offer relatively comprehensive health benefits, doing so is discretionary. Thus, apart from these few mandated benefits, employers give meaning to the employer health plan, but once defined, equal protection principles attach.

HIPAA also requires insurers to issue coverage to any group who applies (“guaranteed issue”) and renew coverage in subsequent years (“guaranteed renewal”), ensuring all groups can get coverage, even if at high prices. This means that all employers can obtain group plans and all members of an employer group can participate on relatively similar terms in any plan their employer chooses to offer.

Those seeking coverage on their own in the individual market have had fewer guarantees and less access to healthy risk pools, prior to PPACA. States regulate, to varying degrees, the

41 Most buy stop-loss coverage, transferring risk to a stop-loss insurer; yet, the law maintains the distinction, even if myth.
42 KFF EMPLOYER HEALTH BENEFITS: 2011, supra note 22, at 151, ex. 10.1.
47 EQUAL EMPLOYMENT OPPORTUNITY COMMISSION, INTERIM ENFORCEMENT GUIDANCE ON THE APPLICATION OF THE AMERICANS WITH DISABILITIES ACT OF 1990 TO DISABILITY-BASED DISTINCTIONS IN EMPLOYER PROVIDED HEALTH INSURANCE, No. N-915.002 (June 8, 1993).
49 42 U.S.C. §300gg-26 (2012). Certain plans that cover under 50 employees or experience an increase in claims costs of over one percent as a result of compliance may be exempt.
design and content of insurance policies, including, for example, mandating coverage of certain benefits. While most states’ laws include some substantive regulations of benefits, few regulate the pricing and issuance of coverage in the individual market. Only a small minority of states have extended HIPAA-like rules to the state individual market; six states require guaranteed issue and one-third of states limit the variability in premium prices allowed among insureds. The result is that individual market insurers in most states can issue, decline, or differentially price insurance based on an individual’s health (or perceived health) – a practice known as underwriting or “risk rating.” To the degree an insurer judges an individual as high-risk, it has historically been allowed to subject her to high premiums or coverage exclusions (e.g., carve outs of pre-existing conditions or low benefit limits), or deny her coverage, to the extent allowed by a state’s laws. Americans disagree on the desirability of risk rating, based on differing conceptions of which types of risks should be shared and which should be borne individually through higher premiums or coverage exclusions.

Underwriting is time consuming and expensive, resulting in high overhead costs that make the individual-market policies relatively more expensive than group-market policies. In turn, many people cannot afford coverage or pay more than they would in group markets for the same level of coverage. One study reported that in 2005 nearly three in five adults who applied for coverage in the individual market didn’t buy it because they were denied coverage, quoted unaffordable prices, or had a health problem excluded from coverage. In states with relatively unregulated individual markets, insurers reject as many as 30-40% of applicants. Some who do obtain coverage in the individual and small group markets are considered “underinsured.” Only one-third of those with individual market coverage rate their coverage as “excellent” or “good.”

The combination of structural and regulatory fragmentation has thus led to highly variable insurance coverage among Americans and no coherent vision of what an American right to health care might entail. In particular, those who must resort to the individual market, especially if perceived as high-risk applicants, are more likely to have poor or no coverage. U.S. law and regulation has thus created a fragmented system with no common baseline in which people in need of health care often fall through the cracks.

PART 2: THE LIMITED ROLE OF THE JUDICIARY IN DEFINING A RIGHT TO HEALTH CARE

Attempts to address these inequities through litigation have faltered in the face of structural barriers – substantive, procedural and political. Because of these barriers, litigation has not played the role in defining or expanding health equity in the U.S. that it has in other countries. In fact, U.S. courts have largely rejected rights-based claims to health care. Litigants have, however, had some, limited success with contractual claims to remedy wrongful denial of covered benefits for eligible enrollees. These lawsuits serve to preserve the contractual status quo but do not markedly stretch the bounds of access to health care.

A. No Constitutional Right to Health

The American legal structure is one that in general favors negative rights – or liberties – and disfavors positive rights. A primary reason why litigation has not played a major role in defining or guaranteeing a right to health care is because the U.S. Constitution has no explicit right to health, nor have the courts read an implicit one. The Supreme Court, as part of its resistance to an expansion of welfare rights more generally, has declined to read a right to health into the substantive due process provision of the Fourteenth Amendment to the Constitution, a provision protecting against deprivations of life, liberty, or property. In the 1960s to 1970s, many scholars and activists thought the court would interpret the Fourteenth Amendment to guarantee welfare as a fundamental right, which would have implied a guarantee of health care, at least for the poor, but such predictions never came to fruition.

Quite the opposite has occurred. Over the past few decades, Supreme Court decisions have explicitly dismissed a state obligation to pay for or guarantee health care, even to indigent populations. Even benefits under public insurance programs, Medicare and Medicaid, are not considered property for constitutional purposes and thus can be revoked. Further, in some recent cases, the courts quashed claims of a right to access a particular medical service or item, regardless of the source of payment for care.

The Supreme Court has, however, delineated a very limited guarantee to medical care for those in state custodial control, under the Eighth Amendment to the Constitution’s prohibition of cruel and unusual punishment. This right was recently reaffirmed in Brown v. Plata, where the

63 Jost, supra note 61, at 26.

65 Jost, supra note 61, at 28.

court ordered California to reduce its prison population by nearly 25% because prison overcrowding prevented provision of necessary medical care and mental health care to inmates.  

This narrowly-defined right only attaches in circumstances when the state has first restrained the individual’s liberty through incarceration or other means.  

In addition, the Supreme Court has recognized health-related liberties, such as the right to refuse treatment, obtain contraception, or have an abortion. 

Several scholars argue these liberties, together, could be read to carve out a “negative” right to health that protects individuals from excessive government interference with health decisions, but the court has never explicitly acknowledged such a right. Even if read in such a light, these negative rights do not create any governmental obligation to guarantee health care; quite the opposite, they guarantee freedom from government interference.  

State constitutions, while gesturing at health care rights textually, similarly do not tend to create any broadly enforceable right to health care in application. According to research by Professor Elizabeth Weeks Leonard, about one-quarter of state constitutions mention the importance of public health and welfare or the responsibility of the state to care for the indigent, insane, or incarcerated, but court interpretation of these provisions has not construed them to confer a right to health care. With no acknowledged positive constitutional right to health (or health care) at the federal or state level, litigants lack an overarching hook for legal claims to a right to health care.  

B. Limitations on Private Rights of Action  

The Supreme Court’s cabining of private rights of action to enforce even contractual or statutory rights to medical care has further minimized the role of the courts. This erosion of individual access to the courts, which has occurred beyond the sphere of health care, has significantly limited health care litigation.  

For example, courts have limited Medicaid beneficiaries’ standing to sue state agencies or officials for violations of the federal conditions of the Medicaid program. Medicaid does not have a private statutory enforcement mechanism of its own. Beneficiaries have relied primarily
on 42 U.S.C. § 1983, a Civil Rights Act provision that accords a private right of action against government actors for “deprivation of any rights, privileges, or immunities secured by the Constitution and laws.”

Scaling back this practice, a 2002 Supreme Court decision, *Gonzaga University v. Doe*, narrowed the use of § 1983 to seek remedy for individual harms. In *Gonzaga*, the Court barred individual § 1983 challenges for the violation of conditions of federal spending programs, under the theory that such conditions – set by the federal government for participating states to follow – do not create individually-enforceable rights. Applying *Gonzaga*, most federal courts of appeal have rejected the use of § 1983 suits by Medicaid beneficiaries for enforcement of certain Medicaid provisions, including the so-called “Equal Access Provision.” This provision requires states to pay providers reimbursement rates sufficient to enlist adequate provider participation in Medicaid with the stated goal of guaranteeing that Medicaid patients have the same access to medical care as their privately-insured neighbors. The appellate courts have reasoned that the Equal Access Provision establishes a contract between the federal government and participating states and does not create any individually-enforceable rights, as in *Gonzaga*.

With § 1983 causes of action unavailable to challenge state Medicaid reimbursement policies, beneficiaries and providers have attempted novel approaches to expand health care rights via litigation. After the state of California cut Medicaid provider reimbursement rates by 10% in 2008 to address budgetary crisis, litigants claimed state reimbursement policies were inconsistent with Medicaid’s Equal Access Provision, a federal law, and thus void under the U.S. Constitution’s Supremacy Clause, which invalidates state laws in conflict with federal laws. The Supreme Court recently remanded this case on other grounds, not reaching a decision on the standing issue but suggesting hostility to the Supremacy Clause standing arguments.

As with public insurance, the Supreme Court has foreclosed many individual rights of action to remedy harms arising from private insurance practices. A 2004 Supreme Court decision, *Aetna Health v. Davila*, prevented enrollees in employer plans from suing insurers in state court for harms resulting from denials of coverage, by interpreting ERISA’s provision on remedies (§ 502) to preempt these state causes of action. Those injured by utilization review activities, insurance company review of requests for medical treatment under a policy, can still seek remedy in federal court under § 502, but remedies under § 502 do not include compensatory damages for harms or punitive damages, as available under state law. This means that if an insurer denies a benefit under an employer plan as not “medically necessary,” and the insured, as

a result, suffers serious injury or death, the only remedy is the cost of the denied medical care. This interpretation provides little counterweight to managed care companies’ incentives to limit care to save money, if the worst that can happen in the subset of denials actually challenged court is that they are later obligated to pay for denied benefits.

The one case in which both publicly and privately insured have recourse through litigation is to vindicate contractual claims if wrongly denied eligibility or medical items or services that are arguably within the scope of enumerated benefits. For example, beneficiaries can still bring § 1983 challenges for violations of Medicaid’s “Reasonable Promptness Provision,” limiting wait times to access covered services, and the “Minimum Services Provision,” requiring states to provide beneficiaries services for which they are eligible, because both provisions have been interpreted as creating individually-enforceable rights. Medicare beneficiaries have access to administrative appeals and, if they exhaust the administrative process and the amount in controversy is over USD $1000, may challenge benefits or eligibility denials in federal court. Such challenges, often seeking coverage of new technologies, drugs, and devices as “medically necessary,” can unlock access to these items or services but more often than not fail, as courts usually defer to Medicare administrators’ determinations. Finally, for services that are not already covered, an individual may seek a “national coverage determination,” a decision by the secretary of Health and Human Services to add coverage of a new item or service to Medicare benefits.

For private plans, even though a member of an employer plan cannot sue her insurer to remedy harms from utilization review, she can still challenge a benefits denial and, if successful, gain access to wrongfully denied benefits. First, she can bring a suit under § 502, as discussed above; however, courts are highly deferential to plan administrators, as they are to Medicare administrators. Second, most states also have state external review statutes that require an independent review of plan utilization review decisions. The Supreme Court determined these statutes survive ERISA preemption, on the logic that reviews do not replace § 502 as the sole remedial provision; the court reasoned that decisions of external reviewers are only enforceable through a § 502 claim in federal court, in which the independent review serves as evidence. PPACA, however, attempts to reinvigorate and expand the reach of independent external reviews, by requiring that all health plan decisions be subject to a binding independent external review. Nonetheless, even if universal and binding, these external reviews provide, at best, access to benefits arguably covered within the terms of plan benefits.

In sum, the Supreme Court has limited private rights of action and remedies so that litigation is available only to vindicate contractual rights to covered medical care. Courts rarely expand access to health care beyond the explicit terms of coverage and generally do not hear cases attempting to challenge systemic barriers to care, such as low reimbursement rates. Thus, litigation can affirm the status quo and perhaps stretch it a bit, under broad interpretations of medical necessity, but it rarely pushes the bounds of access to health care beyond contractual

PART 3: A RENEWED OPPORTUNITY FOR A RIGHT TO HEALTH CARE THROUGH HEALTH REFORM

In light of the constraints on litigation, legislation is proving a more successful pathway for an evolving right to health care in the U.S. Starting with the creation of Medicare and Medicaid, continuing with the federal and state regulations that increase risk pooling and thus promote more equitable access to care among members of a group health plan, discussed above, and most recently with PPACA, legislation has offered incremental steps toward a more robust notion of a right to health care. Each statute defines a new baseline for guarantees to medical care. With the initial statutory suggestion of a more ambitious baseline, some portion of the public often recoils but then, over time, largely adjusts to the new conception. For example, while Medicare was only slightly more favored than not at its passage, it is now one of the most popular U.S. social welfare programs with 90% approval ratings. At a time when Americans agree on little, most support Medicare and the notion that the elderly should have affordable access to good health care.

PPACA offers an opportunity to advance a more expansive baseline conception of a right to health care for the non-elderly in two main ways. First, PPACA attempts to increase access to insurance by regulating private insurance markets to serve social ends and by expanding public coverage. Second, once coverage is more universal, it aims to make it meaningful, by more tightly regulating the content of all health insurance – public and private. Embodied in this expansion of coverage and benefits is an implicit conception of what risks should be shared more collectively. In other words, PPACA redefines who should have a right to care and the core of what this right must contain.

A. Expanding Access

PPACA’s central goal is to make insurance available and affordable for many of the 50 million uninsured Americans, which can be seen as supporting a right to access health care through insurance for most Americans. One key way PPACA actualizes this goal is by regulating private insurance, in particular the individual market. PPACA’s regulation of the individual market for health insurance eliminates many of the mechanisms insurers previously relied upon to select healthier applicants and limit risk pooling. For example, PPACA requires that insurers must issue coverage to all applicants (“guaranteed issue”) and prohibits them from excluding coverage of preexisting conditions. Further, it prohibits most discrimination in pricing based on health status, by limiting the factors on which premiums for a policy may vary to only four: age (allowing variation up to a ratio of 3:1); geography; family size; and tobacco use status (allowing variation up to a ratio of 1.5:1). Permitting continued rating on these

---

104 Support may not ensure survival, as evinced by Vice-Presidential candidate Paul Ryan’s proposal to dismantle the Medicare program.
105 It also addresses health care delivery and public health infrastructure. See Howard K. Koh & Kathleen G. Sebelius, Promoting Prevention Through the Affordable Care Act, 363 NEW ENG. J. MED. 1296, 1296-97 (2010).
107 Id.
108 Id.
factors suggests a right to health care is not absolute and that smoking or living in an area with expensive care, for example, could qualify this right. These rules, however, make individual market policies more universally accessible and affordable, by requiring more even distribution of health risks among all individually insured, as has been the case previously for members in a group plan. PPACA also attempts to make it easier for people to find and purchase these newly-regulated private policies, by directing establishment of a state-based system of “exchanges” for individuals and small groups.\(^\text{109}\)

In conjunction with easing access, the law requires that most Americans carry health insurance, through a provision that has become known (and loved or hated) as the “individual mandate.”\(^\text{110}\) The individual mandate requires all Americans carry “minimum essential coverage,” defined as the level of coverage provided by most employer and exchange plans, or else pay a “shared responsibility payment” – a tax penalty, the amount of which is determined based on income but cannot exceed the average price of a bare-bones insurance policy on the exchange.\(^\text{111}\) Some are exempted from the mandate and penalty for reasons including religious objection or affordability, defined as when premiums cost over eight percent of household income.\(^\text{112}\) Nonetheless, the mandate will prevent adverse selection, or the tendency of healthier people to opt out of buying coverage, especially because new guaranteed issue and community rating requirements enable them to buy in later with impunity if their health worsens. The mandate nudges both healthy and sick to buy coverage, thus diversifying risk pools and moderating premiums. The mandate can be thought of as requiring all Americans take part in this evolving system, some by financing care for those in their risk pools for others who are less lucky or healthy.

Furthermore, to make coverage affordable for lower-income individuals, PPACA offers two solutions. First, it creates federal premium subsidies on a sliding scale for private insurance purchase by those who earn up to 400% of the FPL and do not have access to either Medicaid or an “adequate” and “affordable” employer plan.\(^\text{113}\) Second, in order to cover the lowest-income Americans, PPACA expands eligibility for Medicaid to individuals earning up to 133% of the FPL, regardless of their age, health status, or family status, beginning in 2014,\(^\text{114}\) growing this existing pocket of a right to health care for the poor to more people. The Congressional Budget Office initially predicted this Medicaid expansion would include about 17 million additional enrollees by 2021,\(^\text{115}\) but subsequently lowered its estimates by about 6 million because of the Supreme Court decision on the Medicaid expansion, discussed below.\(^\text{116}\)

**B. New Mandated Benefits and Cost-Sharing Limits**

In addition to making insurance more accessible and affordable, PPACA creates new

substantive requirements for covered benefits and policy terms, especially in the individual market but also to some degree for Medicare and Medicaid. These requirements give definition to the meaning of this expanded right to health care, creating a more consistent baseline of coverage among all insured. In essence, PPACA implicitly asserts what is substantively core to an American right to health care.

PPACA’s coverage regulations do not apply uniformly to all insurance plans but should nonetheless address the greatest sources of current variability in benefits among different types of plans. For example, as part of the compromise necessary to enact the law, plans in place before September 23, 2010 are considered “grandfathered” and exempted from certain PPACA regulations so long as they make only limited changes to existing benefits and cost-sharing structures. But it is expected that many plans will relinquish grandfathered status over time and become bound by more of PPACA’s regulations.

One key substantive policy is a new floor of mandated benefits for non-grandfathered health plans sold in the individual or small group markets. These “Essential Health Benefits” (EHBs) include categories such as emergency services, mental health and substance use disorder services, prescription drugs, and rehabilitative services and devices. New Medicaid enrollee plans must also cover EHBs. Large group and self-insured employer plans are not required to cover EHBs, but since most of these plans already do cover them, the regulations in effect align other plans with these large group policies.

In addition, all non-grandfathered health insurance plans must cover certain preventive care without any cost-sharing obligations, such as screenings for breast, cervical, and colorectal cancer or alcohol-misuse and tobacco-use counseling. First dollar coverage can be understood as defining certain services as so central to a right to health care that insurance should cover them in full to ensure everyone access. As of March 2011, PPACA also eliminated copayments for certain preventive services for Medicare and Medicaid beneficiaries. PPACA is expected to result in first-dollar coverage of preventive services for about one-half of all Americans by 2013, and more over time as plans relinquish grandfathered status.

Finally, the law restricts the total cost sharing a plan might impose on an insured in order to avoid erosion of insurance plan value through cost shifting. The law caps annual out-of-pocket limits for all private health insurance policies. These caps are set at the dollar value limits in the tax code for allowable out-of-pocket spending for high-deductible health plans.

which were USD $6,050 for individual and USD $12,100 for family coverage in 2012.\textsuperscript{129} In addition, PPACA prevents certain health plans from imposing annual or lifetime spending limits on EHBs.\textsuperscript{130} Finally, all plans offered by an insurer participating in a state exchange must have at least a 60% actuarial value with respect to EHBs, even for policies sold by that insurer outside of the exchange,\textsuperscript{131} meaning that the plan must pay on average for 60% of total expenses for EHBs covered under a policy. These restrictions on out-of-pocket spending ensure that insurance coverage will indeed finance a significant part of covered benefits so that beneficiaries will be able to afford and access medical care, even in cases when their medical needs are intensive.

All of these changes, together, redefine private markets as a site for realizing more equitable access to medical care. The law requires that private insurance policies be widely available, reasonably priced, and high-value, and then provides subsidies for low-income enrollees to buy them. As was previously the case for public insurance, private insurance will take on more of the characteristics found in social insurance programs of other countries, such as tax-based financing, broad risk spreading, and access to a fairly rich range of benefits with limited cost sharing.\textsuperscript{132} With greater similarities between the functions and characteristics of public and private coverage, the lines between and the goals of each may start to blend – both in effect and perhaps in the public’s imagination. Both become key parts of a plan to guarantee a more equitable right to health care among Americans.

C. Limitations of PPACA

PPACA attempts to accomplish a significant expansion in health care equity, but it falls short in several respects. As noted above, even PPACA’s provisions that serve to reshape private market coverage apply to only some policies and some benefits. In addition, PPACA ensures access to insurance, not necessarily to medical care, and could result in shortages of available physicians to treat the newly insured,\textsuperscript{133} as occurred in Massachusetts after the state enacted a similar coverage expansion in 2006.\textsuperscript{134} Medicaid enrollees might have particular difficulty accessing care if providers, especially specialists, increasingly refuse to care for patients because of low reimbursement rates.\textsuperscript{135}

Finally, the reform does not realize a universal right. The Congressional Budget Office (CBO) estimates the law will insure about 30 million more Americans within a decade; yet, millions will remain uninsured.\textsuperscript{136} Future uninsured include about one-third “unauthorized immigrants,” who are ineligible for Medicaid or subsidies through the exchanges, one-quarter of individuals eligible for Medicaid who do not enroll, and those who are exempted from or choose not to comply with the individual mandate.\textsuperscript{137} Despite these limitations, PPACA does take a

significant step toward defining a vision for an emerging, albeit not fully realized, right to health care.

PART 4: TESTING THIS VISION FOR AN EMERGING RIGHT TO HEALTH CARE IN THE COURTS OF LAW AND PUBLIC OPINION

Unsurprisingly, in light of the way PPACA alters the distribution of health resources and challenges basic assumptions of private market ordering, the law has prompted early backlash and challenges in both the court of public opinion and courts of law. PPACA has by no means captured the American imagination yet (and may never do so). At any point from the time of passage until now, no more than half of Americans viewed the reform favorably, although most of its policies, when viewed individually, are highly popular. Some commentators went as far as to blame PPACA for the Democratic Party’s loss of majority control of the House of Representatives in the 2010 mid-term Congressional elections, which occurred shortly after its passage; even if only partially true, such claims reflect the perception of strong negative reactions to the law.

A. Legal Challenges

For the law to have any chance of having a longer impact, it first had to withstand legal challenges. Ironically, in light of the past insignificance of courts in shaping a right to health care in the U.S., the courts took on a critical role: either ratify or veto PPACA’s vision of an emerging right to health care. The Supreme Court had the final word and chose to ratify it (mostly).

The pieces of the law under assault were, not surprisingly, the Medicaid expansion and the individual mandate, two foundational policies for setting new baselines. In fact, the individual mandate is often referred to as the “lynchpin” of the private insurance market reforms because of its role in preventing adverse selection and creating more heterogeneous risk pools, as discussed above.

The challengers claimed that these two provisions of the law were enacted without proper Congressional authority. The states’ challenge to the Medicaid expansion succeeded in part. Under a “coercion and commandeering” theory, half of the states claimed that PPACA’s Medicaid policies placed untenable conditions on the states. The Supreme Court has held in the past that Congress can condition states’ receipt of federal funds so long as the conditions are unambiguous and don’t rise to the level of compulsion. The states claimed the requirement for a state to cover all individuals up to 133% of the FPL or lose existing Medicaid funding rises to

---

142 CBO 2011 ANALYSIS, supra note 115, at 18.
the level of compulsion. In other words, they claimed states had no choice but to expand their programs.

Although the expansion will be mostly federally funded (90-100% in the first decade), it does place burdens on the states, particularly given how thinly stretched states’ budgets have been throughout the recent recession. Most importantly, to qualify for federal expansion funding, PPACA requires states to maintain pre-reform eligibility standards (“maintenance of effort”). Furthermore, it requires a state to pay its full matching share for new enrollees who had been eligible under old rules but had not previously enrolled. Finally, the federal share of expansion funding could decrease over time, leaving states responsible for a growing share of the costs.

In a decision surprising to many, the Supreme Court agreed with the states’ arguments, striking the provision of the law that would strip states of existing federal Medicaid funding if they failed to expand eligibility to 133% of FPL. No lower federal court had found these arguments compelling. Even a conservative judge dismissed the Medicaid claim as having “simply no support.” Nonetheless, the Supreme Court found the fact that states would lose all existing funding if opting against the expansion to rise to the level of compulsion. The remedy, however, was mild. The court simply struck the provision that said that states that failed to expand would lose current federal funding, leaving the rest of the expansion and related conditions intact. The result is that states can keep their current programs and decline federal money for expansion or expand in compliance with all of the conditions in the law and get the federal expansion funding. Because of the high value of the federal matching dollars, most states are expected to expand eligibility, despite early grumbling to the contrary.

Also unexpected by many, the individual mandate survived completely unscathed. Furthermore, its survival turned on a different legal argument and court majority than anticipated. The challengers – uninsured individuals, a federation of small businesses, and 26 states – asserted that Congress didn’t have the authority under its enumerated powers to compel individuals to buy insurance they would not have otherwise purchased. In contrast, the Administration argued that Congress had the power under its authority (1) to regulate interstate commerce (“Commerce Clause” power), (2) to use means necessary and proper to carry out enumerated powers; and (3) to tax and spend for the general welfare.

Most observers thought if the mandate survived it would be based on the Commerce Clause power, which was the argument favored by lower federal courts, scholars, and commentators, as well as explicitly asserted by Congress in the text of PPACA as the grounds for its authority. The Commerce Clause power provides that Congress can regulate activities

---

149 Id. at 2607.
when it has a “rational basis” to conclude that the activities “taken in the aggregate, substantially affect interstate commerce.” 154 The plaintiffs argued that the Commerce Clause power does not allow Congress to regulate inactivity. That is, an individual’s decision not to purchase insurance is not activity contemplated by the Commerce Clause’s legislative reach. The lower federal courts came to mixed decisions on this argument.155

In a decision surprising to many, based on lower court decisions and general buzz, the court rejected the Commerce Clause argument,156 agreeing with the plaintiffs’ inactivity/activity distinction, but found the mandate constitutional under Congress’s taxing power.157 To come to this decision, the court had to find that the mandate, which was called a “penalty” in PPACA, is in fact a tax. It did so based on the fact that the mandate is directed at taxpayers and the enforcement mechanism occurs through the tax system, to the dismay of some Democrats who for political reasons resisted the characterization of the mandate as a new tax.158

Not only was the legal reasoning unexpected, but the makeup of the majority also came as a surprise. Many anticipated Justice Kennedy to cast the deciding vote;159 Chief Justice Roberts instead played this role, joining with the four liberal Justices to uphold the mandate, despite his own conservative leanings. Although it is impossible to know why Roberts upheld the mandate, some posit he was balancing a long-term strategy to erode Congress’ Commerce Clause power with a short-term desire to protect the institutional integrity of the Court, which might have been compromised if the court overturned a major social reform law in a seemingly political decision. Regardless of his motivation, the court affirmed a law that serves to expand more meaningful insurance coverage to over 30 million more Americans.

Thus, the Supreme Court, which has historically played little role in defining or defending a right to health care, has now validated a law that envisions a much broader conception of a right to health care in the U.S. This law – for both normative and political reasons – divided the Supreme Court in charged and unexpected ways. Yet, it survived, perhaps foreshadowing a similar battle ahead in the court of public opinion. Professor Jack Balkin asserted that the court affirmed a new social contract, legitimating the most major change in U.S. social policy by Congress in decades.160 The open question is whether Americans will eventually accept and perhaps even embrace this social contract.

B. An Opportunity to Build Consensus in the Court of Public Opinion

Formal law, even if validated by the Supreme Court, does not necessarily lead to a change of consciousness among Americans, but it does redefine the status quo and offer a different way to think about insurance institutions. If the law survives continued legal challenges throughout implementation, political calls for repeal, and Americans’ current ambivalence, as

154 Gonzalez v. Raich, 545 U.S. 1, 22 (2005).
158 Id.
discussed below, it has the potential to begin to reshape public conceptions about the appropriate level of access to medical care for all Americans.

In particular, PPACA, over time, could change what Americans expect from private health insurance. In the past, private insurance, especially in the individual market, operated so that market forces allocated access to medical care on the basis of ability and willingness to pay. PPACA redefines private insurance so that it becomes a locus for more affordable and meaningful coverage and thus asserts that health insurance markets are fundamentally different than other private markets.

In light of these transformative changes to the private insurance system and the expansion of public coverage, it is possible that Americans might embrace – or at least accept – the idea that public and private insurance can and should work together to ensure greater health care equity. PPACA asks all Americans to adopt and participate in a system of financing where those who need medical care can access it. This law could help develop a new norm of universal access to care and broader sharing of health resources, as commonly exists in countries with universal coverage.161 The universal social insurance programs of Medicare and Social Security have only become more popular over time as Americans see the benefit of such programs for themselves, friends, or family members.162 PPACA creates the structure for a solidarity-based system of health care financing for all Americans. The question is whether the public consciousness will grow to accept this solidaristic norm and support a notion of sharing of health resources more collectively or whether, conversely, the law will face sustained backlash that could erode support for health solidarity. My hopes are that it will create a slow evolution toward the former over time. Of course, even if it succeeds in doing so, as many of the other chapters of this book illustrate, universal access invites second order problems, including managing costs and contentious battles over allocation of resources (i.e. rationing).

CONCLUSION

Even though Americans lack strong ground on which to make legal claims to a right to health care, legislation, including PPACA, has advanced the development of this right. PPACA establishes a structural and conceptual foundation for a broader sharing of health resources. In a country where a fragmented insurance system has resulted in inequitable access to medical care, and where private insurance excluded millions, private insurance might ironically become a strong thread in a more solid fabric of equitable coverage. PPACA’s regulation of private insurance recasts it as a market supporting a social mission so that health insurance – public and private alike – can become a foundation for greater health care equity. If enduring, the law has the potential to shape how Americans experience and conceptualize health care rights and the role of public and private insurance in supporting such rights.

To many, the reform is too modest. Some will remain uninsured or underinsured. Even with insurance, some Americans might lack access to health care. And costs will continue to rise, putting increasing pressure on the system. While clearly not the end of the story, PPACA is nonetheless an important chapter, outlining a vision for an emerging American right to health care. The question remains whether public consciousness will follow this vision and whether Americans might eventually espouse widespread support for a right to health care.
